The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ᵃ, ᵇ, ᶜ, etc., number of days missing; for example, ᵇ, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 17

Only one minor flood occurred this month, that being in the Grand River, at Chillicothe and below, from the 13th to 15th. Elsewhere river stages were normal, or below, during the month, as a rule.

The cold weather and frequent rains and snows seriously curtailed all field work during March and at the close of the month very little planting, or preparation for planting, had been accomplished. Only a small percentage of the oat crop had been sown and very few gardens, potatoes, or truck fields had been planted. Wheat and grasses made some growth the latter half of the month, but warmer weather was needed for more rapid growth. The winter wheat crop came through the winter in very good condition and the snow cover during the coldest weather, the first week of March, was very beneficial in protecting the crop. Fruits buds were held back by the prevailing low temperatures and only during the latter part of the month did buds of early developing trees and shrubs begin to swell. It was a bad month for livestock and dry feeding was necessary during most of the first two or three weeks. Much warmer and drier weather was badly needed as the month closed, to dry out fields so they could be worked and planted to early crops.—M. R. W.

TEMPERATURE

The monthly mean for the State, 103 stations reporting, was 37.4°, or 6.7° colder than the 60-year March average. The highest monthly mean was 43.8° at Caruthersville, and the lowest was 31.4° at Unionville. The highest reported was 77° at Eldon, on the 22d, and the lowest was 7° below zero at Bethany, on the 3d.

PRECIPITATION

The average for the State, 210 stations reporting, was 2.80 inches, or 0.43 inch less than the 60-year March average. The greatest monthly amount was 5.58 inches at Polo, and the least was 1.12 inches at Doniphan. The greatest amount reported in 24 hours was 2.47 inches at Polo on the 12-13th. The average number of days with 0.01 inch, or more, was 11.

Snowfall for the State averaged 8.8 inches, or 5.8 inches more than the 57-year March average. The greatest monthly snowfall reported was 26.0 inches at Mexico.

MISCELLANEOUS PHENOMENA

Aurora.—2d

Flood.—In Grand River, 13th to 15th.

Fogs.—Heavy, 1st, 2d, 4th, 11th, 20th, 24th, 27th.

Frosts.—Light, 22d, 28th, 30th; heavy, 14th, 16th, 18th, 22d; killing, 3d, 4th, 15th, 16th, 17th, 18th, 20th, 21st, 22d, 25th, 26th, 27th, 28th, 30th.

Glaze.—1st, 5th, 6th, 17th, 18th, 24th, 27th.

Hail.—Light, 5th at Springfield; 24th at Auxvasse, Columbia, Elsberry, Fulton, Kirksville, Martinsburg, Mexico, New Florence, Polo, Saverton, Shelbina, Steffenville, Warrenton, Bolivar, Warsaw, Advance, Richwoods, St. Louis, St. Louis Airport, Steelville; 27th at Seymour and Springfield; 31st at Appleton City, Bolivar, Lockwood, Roby, Salem. Moderate, 24th at Cape Girardeau and St. Louis University. Heavy, 31st at Carrollton. (See special storm table).

Sleet.—1st, 5th, 6th, 7th, 19th, 20th, 24th, 26th, 27th, 31st.

Windstorm.—No damaging windstorms reported.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. (C) Airport.
‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for March 1947

(See precipitation data in daily precipitation table)

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

Missouri Storms, March 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Carroll	31	11:25 p.m. to 11:40 p.m.	Heavy hail	....	....	....	None	$7,500	Storm occurred at Carrollton and the surrounding area, resulting in slight damage to at least 500 buildings, mostly to roofs, local greenhouses, automobiles and trees. Some slight damage was done to wheat. The stones averaged one inch in diameter with some two inches, covering the ground.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

Daily Temperatures for March 1947

VOL. LI APRIL 1947 No. 4

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

SEP 16 1947

GENERAL SUMMARY

Although the average temperature for the State was practically normal during April, it was a very wet month, plagued by high winds, frequent thunderstorms, tornadoes, hailstorms, and prolonged floods, all of which combined made it a very unfavorable month for outdoor and field work. At the close of the month only a small percentage of the usual early spring planting of crops had been accomplished and this work was three to four weeks later than average for that time of year.

It was the fourth-wettest month of its name in the past 60 years, only April 1893, 1927, and 1945 averaging wetter than the current month. Precipitation during the month was practically all in the form of rain, snowfall being of little consequence, with measurable snowfall occurring at only a few stations in the extreme northwestern corner of the State. Monthly precipitation ranged from a total of 12.28 inches at Neosho to 3.22 inches at Doniphan. Rains were quite frequent, and at times heavy to excessive, occurring on an average of 13 days during the month, for the State, as a whole, while some stations had measurable rain on 18 or 19 days. All three divisions of the State received considerably more than normal precipitation, the averages with departures, being as follows: Northern Division, 6.42 inches, +2.91 inches; Southwestern Division, 7.27 inches, +3.02 inches; Southeastern Division, 6.64 inches, +2.17 inches; for the State, 6.78 inches, +2.70 inches. The frequent and persistent rainfall during the first week of April caused most rivers of the State to rise steadily, exceeding flood stages early in the month. Subsequent frequent heavy rains throughout the remainder of the month increased and prolonged the floods which extended into May, in portions of the Mississippi, Missouri, Osage and St. Francis Rivers. On the Missouri, at Jefferson City and below, crest stages this month were the highest since April 1945, while at Waverly and Boonville, the crests were the highest since June 1945 and May 1944, respectively. On the Mississippi River crests at Grafton and Chester, Ill., were the highest since May 1944, while at St. Louis the April crest was the highest since June 1945.

The month averaged 4.4° colder than April a year ago and it was the coldest month of its name since 1944. Extremes of temperature were not unusual. The 10th, 23d and 30th were the warmest and the 7th and 17th the coldest days during the month, as a rule. Freezing, or below, occurred on an average of only one day, for the State as a whole. Although frost formed on many nights from the 7th to the 26th there was very little damage due to the fact most crops, gardens, and truck had not been planted or were not suffcently advanced to be injured; also, the frosts were not severe enough, as a rule, to damage fruits or other crops that were advanced enough to be susceptible. The Southeastern Division had the highest monthly mean of 57.3°, or 0.3° above normal. The averages for the Southwestern and Northern Divisions, with departures, were 56.0°, −0.2° and 52.2°, −1.0°, respectively.

A number of damaging storms occurred during the month and are tabulated elsewhere in this issue.

(Continued on page 27)

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

Continued from page 25

Sunshine averaged approximately 8% less than normal this month, for the State as a whole, and each of the six stations equipped with sunshine recorders had 5% to 11% less sunshine than normal.

The prevailing wet weather and resulting floods seriously delayed planting of all crops and by the end of the month only about 3% of the corn crop had been planted and less than 50% of the intended oat crop had been sown in the northern half of the State, while practically all of the intended oat acreage had been sown in the extreme southern portion. It appeared that much of the acreage intended for oats would be planted to other crops, due to the lateness of the season. Wheat and other fall seeded small grains and all grasses made good growth during April, but needed more sunshine and drier weather the latter half of the month. Considerable wheat and alfalfa, on low bottom land, was flooded and killed, particularly where flood waters remained for a considerable time. Fruit trees and strawberries bloomed heavily during the latter half of the month and prospects for a large fruit crop were very good at the close of April. All fruits were quite late in blooming this spring, because of the prevailing low temperatures during March and the wet, cloudy weather in April. Planting of cotton in the southeastern counties was under way the latter part of the month. A prolonged period of warm, dry weather was badly needed as the month closed, to permit the ground to dry out sufficently so that it could be worked and long delayed planting of crops begun.—M. R. W.

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 55.2°, or 0.1° below the 60-year April average. The highest monthly mean was 61.8° at Caruthersville, and the lowest was 49.4° at Memphis and Unionville. The highest reported was 90° at Union on the 23d, and the lowest was 22° near Black on the 17th.

PRECIPITATION

The average for the State, 215 stations reporting, was 6.78 inches, or 2.70 inches more than the 60-year April average. The greatest monthly amount was 12.28 inches at Neosho, and the least was 3.22 inches at Doniphan. The greatest amount reported in 24 hours was 3.90 inches at Neosho on the 23d-24th. The average number of days with 0.01 inch, or more, was 13.

Measurable snowfall occurred at only a few stations. The greatest monthly amount reported was 2.0 inches, at Oregon.

MISCELLANEOUS PHENOMENA

Dust.—Local, on 5th, 6th, 10th, 18th, 19th, 23d.

Floods.—In Black River, at Poplar Bluff, 12th to 13th; below Leeper, 25th to 28th. In Bourbeuse River, at Union, 26th to 28th. In Gasconade River, at Jerome, 25th to 28th. In Grand River, 4th to 18th and 21st to 24th. In Meramec River, at Pacific, on 22d; at Sullivan, and below, 25th to 30th. In Mississippi River, in the reach bordering the State, on the 6th and continued into May. In Missouri River, at Kansas City, 12th to 13th; at Waverly, and below, on 5th and continued into May. In Osage River, 12th to 20th; on the 25th and continued into May. In St. Francis River, at Fisk, 12th to 20th; on 26th and continued into May.

Fogs.—Heavy, 1st, 2d, 4th, 5th, 8th, 9th, 16th, 20th, 26th.

Frosts.—Light, 7th, 9th, 13th, 14th, 17th, 20th, 21st, 24th, 26th; heavy, 17th, 26th; killing, 2d, 7th, 16th, 17th.

Hail.—Light, 1st at Salisbury, near Seymour, Farmington; 3d at Bethany and University of Kansas City; 4th at University of Kansas City and Altona; 9th at Grant City and Caplinger Mills; 10th at Maryville, Oregon, Appleton City, Lockwood, Roby, Springfield, Wasola, Crane Mountain, Ellington, High Lookout, Macedonia Lookout, West Plains; 15th at Mexico, New Florence, Caplinger Mills, Joplin, St. Louis County; 19th at Centerville and Steelville; 20th at Richwoods; 22d at Appleton City; 23d at Carrollton, Martinsburg, Mexico, Vandalia, Appleton City; 29th at Auxvasse, Carrollton, Fayette, Hannibal, Kirksville, Mexico, Unionville, Warrenton, Bolivar, Eldon, Monett, Springfield, Cook Station, Cuba, St.

Missouri Storms, April 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Bates	4	8:30 p.m.	Wind and moderate hail	SW	2	Unknown	0	Minor	Storm occurred at Butler and vicinity. Several outbuildings and trees were blown down. Hailstones the size of marbles but no damage from hail.
Cedar	5	1:15 a.m. to 1:30 a.m.	Tornado	SW	200 yards	2	0	$200,000	Tornado occurred at El Dorado Springs. Many homes, several business buildings and a church were badly damaged; also several barns, outbuildings, many trees and wires were blown down and electric and telephone service disrupted. One horse and many chickens were killed. One person was slightly injured when cut by flying glass.
Callaway	5	4:30 a.m.	Tornado and high wind	SW	½ mile	2	0	$3,000	Storm struck Dixie and Ham's Prairie areas in southern portion of county resulting in damage to farm homes, outbuildings, roofs, trees, and power and telephone lines. High winds were general over the whole county throughout the day with minor damage reported at Fulton and Hatton.
Bates, Boone, Callaway, Shelby, St. Clair, St. Louis and St. Louis City	5	All day	High straight winds	SW and W	No definite path	....	0	Considerable but total damage unknown	Generally high winds prevailed over the State all day of the 5th with considerable damage reported in the counties named. At Appleton City, and vicinity, small outbuildings were blown over and roofs damaged; estimated damage $1,000. In Boone County, light damage was done at Columbia to trees, wires, plate glass windows, automobiles, chimneys, roofs, and billboards; at Sturgeon and Ashland communities, outbuildings, roofs and trees were damaged; also electric wires at latter place. In Shelby County, at Shelbina, and to the southwest of that place, roofs and outbuildings were damaged. At St. Louis and in St. Louis County, scattered damage was done to plate glass windows, trees, signs and buildings; three persons were slightly injured. See storm above for damage in Callaway County.
New Madrid	20	Early morning	High wind	SW	....	....	0	Not reported	Storm occurred in vicinity of Gideon and Risco, destroying two dwellings and damaging several farm buildings and electric lines. One person was injured.
Howell	20	Between midnight and 1:00 a.m.	Windstorm	SW	100 yards	100 yards	0	$1,050	Storm occurred at Mountain View, and vicinity, damaging three houses, a barn, and other outbuildings.
Worth	29	About 2:25 p.m.	Tornado and high wind	SW	¼ to ½	About 32 in Missouri	14	$772,000	Tornado struck first about 6 to 8 miles south and west of Worth, passed through the town of Worth demolishing the business district and demolished or damaged practically every home or other building in the town. Fourteen persons were killed and between 40 and 50 injured, many seriously, in Worth. Power and communication services were disrupted and trees uprooted or broken. Some livestock and poultry were killed. The storm continued in a northeasterly direction with damage to farm homes and outbuildings in the Denver and Hatfield communities. The storm crossed the Iowa line striking the town of Clio, Iowa. No crop damage resulted, as crops were just being planted. Light to heavy hail accompanied the tornado at Worth, and vicinity. One report stated the hailstones ranged in size from walnuts to baseballs. Many automobiles damaged by falling debris and wind.
Dent, Phelps and Crawford	29	Between 9:00 p.m. and 9:30 p.m.	Tornado and high wind	SW	Varied	About 10	1	$30,000	Storm struck near Lake Springs, in northwestern Dent County and moved northeastward into southeastern Phelps County and southwestern Crawford County, through the Hobson, Seaton and Winkler communities. Several farm homes, barns and other outbuildings were demolished, or badly damaged, and much valuable timber was blown down. Communication lines were disrupted and considerable livestock killed or strayed. One person was killed at Winkler, and five others were injured by the storm. Crop damage was light.
Nodaway	29	2:00 p.m.	Heavy hail	SW	1½	10	0	$12,500 to $18,000	Storm occurred at Maryville and extended 10 miles northeastward. Damage was mostly to roofs, windows and greenhouses. A number of lambs, small pigs and chickens were killed and young fruit trees badly damaged. Wheat and alfalfa were also damaged but were expected to recover. Stones ranged in size from ¼ inch to 3 inches in diameter.
Boone	29	6:00 p.m.	Heavy hail	W-NW	1½	15	0	Reported as severe but no estimate made	Storm occurred at Ashland, and vicinity, damaging roofs, windows, trees, and automobile tops. Crop loss small as practically none had been planted. Stones ranged up to 7 inches in circumference and covered the ground for about two hours.
Callaway	29	Between 7:00 p.m. and 7:40 p.m.	Heavy hail and high wind	W	2	8	0	$2,000	Storm occurred at Fulton, and vicinity, resulting in damage to roofs, windows, greenhouses, and power and communication lines. Approximately 75% of damage was from hail. Storm was accompanied by heavy rain. Hailstones were from ½ inch to 3¼ inches in diameter and covered the ground. No crop damage reported. It is possible this may have been a continuation of the Ashland storm above
St. Louis City	29	Between 10:00 p.m. and midnight	High wind and thunderstorms	W	....	....	0	$10,000	Storm occurred in extreme northeast section of the city, with damage to several buildings, a large floating boat dock, trees, and wires. Storm was accompanied by heavy rain and light to moderate hail in scattered areas of the city and in St. Louis County. Lightning struck three buildings in the area during thunderstorms early in the morning and again at night.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

MISSOURI SECTION

H. F. WAHLGREN
ST. LOUIS, MO.

VOL. LI MAY 1947 No. 5

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

May was a rather cool month, with precipitation averaging slightly below normal. However, it was the most favorable month of the current spring for crop growth and field work, although at the close of the month much of the corn and other crops had not been planted, and plowing and planting operations and advancement of all crops were two to three weeks later than normal for this time of year.

It was the fourth consecutive month of the current year and the third consecutive May with sub-normal average temperature. Temperature extremes were not unusual, for the month as a whole; however, the cool spell the last three or four days of May was the coldest of record for so late in the season, at most places, and a number of stations reported light frost, or thin ice formation, on the mornings of the 29th and 30th, but without material damage, as a rule. The only general warm period during the month occurred from the 11th to the 18th, when daily averages were generally above normal. The prevailing low nighttime temperatures were largely responsible for the temperature deficiency during May, rather than low daytime temperatures, although daytime temperatures also averaged somewhat below normal. Monthly averages, with departures, by divisions, were as follows: Northern, 59.7°, —3.7; Southwestern, 62.9°, —2.2°; Southeastern, 64.2°, —1.6°; for the State, 62.3, —2.1°. Although frost, mostly light to moderate, formed on several nights during the month, very little damage resulted. The 9th, 10th, 29th and 30th were generally the coolest days during May, while the 14th and 15th were the warmest days.

The frequent showers and persistent wet weather that prevailed during April continued the first few days of May, after which there was a brief period of little or no rain anywhere in the State. However, on the 13th showers began again and frequent rains and wet weather continued throughout most of the remainder of the month. Most of the major streams of the State were rising steadily and were already at, or rapidly approaching flood levels, for the second time this month, as the month closed. Precipitation during the month was rather irregularly distributed, ranging from a total of 7.80 inches at Chillicothe Airport to 1.88 inches at Winona Ranger Station. Snowfall during May amounted to only a trace, occurring at a few scattered stations in the central and west-central portions of the State. Rainfall for May was heaviest in the Northern Division where the average was 4.75 inches, or 0.09 inch more than normal. The averages, with departures from normal, for the Southwestern and Southeastern Divisions were 4.54 inches, —0.69 inch and 3.85 inches, —0.72 inch, respectively; for the State as a whole, 4.38 inches, —0.44 inch. It was the driest May since 1941, and averaged 2.50 inches drier than May a year ago. The frequency of the month's rainfall, rather than the total monthly amount, caused May to be characterized as a wet month.

A number of damaging storms occurred during the month and these are tabulated elsewhere in this issue.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 33)

The cool month, with its frequent rains, was generally unfavorable for preparing the ground for seeding of spring crops and for the best growth and development of corn, that had been planted, and for cutting and curing of hay crops. However, it was a very good month for wheat, grasses, and the few oats that had been planted, and these crops made good progress during the month. Wheat was about one-half headed and oats beginning to head in southern portions of State the latter part of May. The brief cessation of rain over the entire State, between the 3d and 13th, permitted all field work to advance rapidly, after having been seriously delayed during March, April and the first two days of May, but there were only brief intermittent periods, after about the 13th, during which farmers could get into the fields to resume work. At the close of May only about 70% of the corn and approximately 30% of the soybean crops had been planted, while cotton planting in southeastern counties was mostly completed, by the end of the month. First cuttings of alfalfa hay were made during the latter half, but this work was hampered by frequent showers. Pastures were in very good condition during May and furnished abundant grazing for livestock. Fruit prospects continued very promising throughout the month, with a few exceptions, and picking of a good crop of strawberries was under way over the greater part of the State, during the last two weeks. Warmer and drier weather was badly needed at the close of the month, to permit planting, replanting, and cultivation of crops and harvesting of hay.—M. R. W.

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 62.3°, or 2.1° below the 60-year May average. The highest monthly mean was 68.2° at Caruthersville, and the lowest was 56.6° at Unionville. The highest reported was 92° at Carthage, Joplin Airport, Lakeside, and Nevada on the 14th, and the lowest was 29° at Elsberry on the 9th and near Black on the 10th.

PRECIPITATION

The average for the State, 212 stations reporting, was 4.38 inches, or 0.44 inch less than the 60-year May average. The greatest monthly amount was 7.80 inches at Chillicothe Airport, and the least was 1.88 inches at Winona. The greatest amount reported in 24 hours was 2.96 inches at Eastwood Lookout on the 24-25th. The average number of days with 0.01 inch, or more, was 11. Only a very few stations reported snowfall, amount being only a trace at any place.

MISCELLANEOUS PHENOMENA

Floods.—In Grand River, at Chillicothe, 29th to 31st. In Mississippi River, in the reach bordering the State, continued from April to May 9th, except at Hannibal and Dam No. 25 where the flood continued from April to May 21st and May 10th, respectively; in the reach from Hannibal to Dam No. 25, on the 28th and continued into June. In the Missouri River, at Hermann and below, continued from April to May 2d. In Osage River, at St. Thomas, continued from April to May 1st. In St. Francis River, at Fisk, continued from April to May 8th.

Fogs.—Heavy, 13th, 14th, 15th, 17th, 18th, 19th, 20th, 21st, 22d, 23d, 24th, 25th, 28th.

Frosts.—Light, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 29th, 30th; heavy, 7th, 9th, 29th; killing, 9th, 29th.

Hail.—Light, on 1st at Brunswick, Fayette, Salisbury, Tarkio, Crocker, Advance, Cape Girardeau, Crystal City, Farmington, Jackson, Puxico, Rolla, St. Louis; 2d at Fulton; 14th at Maryville; 15th at Bethany, Martinsburg, Shelbina, Springfield, Centerville, Reynolds; 17th at Martinsburg and Stover; 27th at Brunswick; 28th at Kansas City University, Maryville, St. Louis; 29th at St. Louis; 31st at Martinsburg. Moderate, 1st at Cassville, Wappapello Dam, southern Pemiscot County (See special storm table).

Tornado.—20th. (See special storm table).

Windstorms.—1st, 15th, 28th. (See special storm table).

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

ERRATA

May 1946, page 34: Date of maximum temperature at Brunswick should be 30th. Mean temperature and departure at Clinton should be 62.3 and −3.2, respectively. Number of days 0.01 inch of precipitation at Kidder should be 15. Date of greatest 24-hours precipitation at Kirksville should be 5–6th. Prevailing wind direction at Nevada should be se. Page 39: Mean maximum temperature at Clinton should be 73.5.

June 1946, page 42: Number of days 0.01 inch of precipitation at Fulton and Trenton should be 3 and 6, respectively. Maximum temperature and date at Marshall should be 97 on 25th.

August 1946, page 58: Number of days 0.01 inch of precipitation at Lexington should be 7. Mean temperature at Sweet Springs should be 75.1.

September 1946, page 66: Mean temperature and departure at Anderson should be 68.4 and −2.6, respectively. Page 67: Mean temperature and departure at Sikeston should be 70.4 and −0.7, respectively. Page 71: Mean minimum at Sikeston should be 57.7.

December 1946, page 94: Evaporation on 6th at St. Louis (Washington University) should be .176. Monthly amount should be 1.148.

Annual 1946, page 99: Evaporation for December at St. Louis (Washington University) should be 1.148. Mean temperature at Sikeston should be 60.2. Page 98: Number of days 0.01 inch of precipitation at Kidder, Fulton, Trenton, and Lexington should be 98, 96, 96 and §59, respectively. Page 102: Mean temperature and departure at Clinton for May should be 62.3 and −3.2, respectively. Mean temperature and departure at Anderson for September should be 68.4 and −2.6, respectively. Page 103: Mean temperature and departure at Sikeston for September should be 70.4 and −0.7, respectively.

January 1947, page 6: Wind movement on 30th at St. Louis (Washington University) should be 69; total movement should be 1553.

Daily Temperatures for May 1947

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs. ^{a}, ^{b}, ^{c}, etc., number of days missing, for example, ^{b} indicates two days missing. Italics data interpolated. § Partly interpolated. (C) Airport.

Missouri Storms, May 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Dunklin and Pemiscot	1	Between 5:00 a.m. and 6:00 a.m.	Wind and hail	SW	10	20 to 30 in Missouri	1	$100,000	Storm moved out of northeastern Arkansas into the two Missouri counties where it resulted in the death of one person at Tyler, injury to about 15 others and widespread damage to buildings, outbuildings, trees, and wires. Bulk of damage was in southern Pemiscot County. Towns reported suffering damage were Hornersville and Arbyrd in Dunklin County, and Hollard, Steele, Cooter, Micola, Tyler, Cottonwood, Caruthersville, Hati, and Wardel in Pemiscot County. Storm was accompanied by small hail which did about $10,000 damage to crops in Pemiscot County.
St. Louis City and East St. Louis, Ill..	15	4:00 p.m.	High wind	SW	....	....	0	Minor	High, gusty wind damaged a few buildings, chimneys, roofs, billboards, and trees in St. Louis, East St. Louis, and Madison, Ill.
Dunklin	20	About 7:00 p.m.	Tornado	SW	....	....	0	Unknown	A small, local tornado struck at Kennett and vicinity, wrecked one building in the town and badly damaged two farm dwellings and a barn northeast of Kennett. No one was reported injured.
St. Louis City and St. Louis	28	Between 9:00 p.m. and 11:00 p.m.	High wind	S	....	....	0	Minor	Trees and wires were felled or damaged in various parts of the City and County. Sharp drop in temperature accompanied the windshift from south to northwest.
Audrain	28	Between 8:00 p.m. and midnight	High wind	......	....	....	0	Unknown	Farm buildings, outbuildings, trees, and wires were reported heavily damaged. Storm occurred at Mexico, and to the south of that town. Some livestock were killed.
Caldwell and Jackson	31	....	Thunderstorms	......	....	....	1	$500	An 18-year old boy was struck and killed by lightning while driving a tractor on a farm near Atherton, Jackson County. At Polo, Caldwell County, lightning struck a new brick house; resultant damage estimated at $500.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

Vol. LI June 1947 No. 6

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

June averaged both cooler and wetter than normal and it was a very unfavorable month for planting, cultivating, and harvesting of crops and for most field work, except in the southern half of the State, where conditions were more favorable. It will be long remembered for the disastrous floods, in some cases unsurpassed, and for the unprecedented rainfall that occurred during the month over the northern half of the State.

It was the fifth consecutive month of the current year with an average temperature lower than normal and it was also the coolest month of its name, except June 1945, in the past nine years. There were no 100° temperatures recorded anywhere in the State during the month, and daytime temperatures of 90°, or above, occurred on an average of only five days, for the State as a whole. Temperature extremes for the month were not unusual, being well within the all-time extremes previously established for June. All divisions of the State averaged cooler than normal, the deficiency being greatest over the Northern Division. Average temperatures, with departures, by divisions were:—Northern, 70.6°, —1.9°; Southwestern, 73.3°, —0.1°; Southeastern, 73.8°, —0.3°; for the State, 72.6°, —1.0°. A number of stations in the Southwestern and Southeastern Divisions had monthly average temperatures in excess of their respective normals, while each station in the Northern Division averaged cooler than normal. The only general and extended warm period during the month occurred from the 6th to the 10th, while above-normal daily averages occurred for brief periods of a day or two at a time on the 20th, 28th, and 30th, as a rule. The 27th, 28th, and 30th were the warmest days, while the 14th was the coolest day, generally, during the month.

The outstanding feature of June was the unusually heavy rainfall, with resultant widespread and very destructive floods over the northern half of the State. For the State as a whole, it was the wettest June since 1945 and the fourth wettest month of its name in the past 60 years. For the Northern Division this was the wettest June of record, 1888-1947. However, heavier June rainfall has fallen numerous times in prior years in both the Southwestern and Southeastern Divisions. Measurable rain occurred on an average of 13 days, for the entire State, while the average for the Northern Division was 15 days. A number of stations in that division reported rain on 17 or 18 days during the month. A monthly total of 23.60 inches fell at Lathrop this month, which is the second largest amount recorded for any month in the past 60 years, the all-time record being 25.54 inches at Joplin in May 1943. It is a rare occurrence, indeed, when as much as 20 inches of rain occurs in Missouri in a period of one month. The average rainfall for June, by divisions, with departures from normal, was as follows:—Northern, 12.00 inches, +7.08 inches; Southwestern, 7.09 inches, +2.00 inches; Southeastern, 5.49 inches, +1.17 inches; for the State, 8.19 inches, +3.41 inches. Heaviest 24-hour amounts reported for each division were 5.65 inches on the 29th at Lathrop, in the northern; 4.50 inches on the 20th-21st at Lexington, in the southwestern; 3.78 inches on the 1st at Eastwood Lookout, in the southeastern.

As a result of the unprecedented rainfall over the Northern Division, and the already high stages of the major rivers and smaller streams prevailing in that section of the State on the first of June, very disastrous, and in some instances, unprecedented floods prevailed throughout the entire month in portions of the Mississippi and Grand Rivers and during the greater part of the month in the remaining portions of those rivers and in the other rivers of that area. In the Mississippi River, from Keokuk, Iowa to Dam No. 25, the highest stages of record occurred, while at St. Louis the highest stage in 103 years was recorded on the 30th and the crest had not been reached at that time. Flood conditions also prevailed in portions of the Black, Meramec, Osage and St. Francis Rivers, but were not as prolonged or as destructive as those in the northern half of the State, occurring during the last few days of June and continuing into July, as a rule. As a result of these unusually extensive, prolonged, and high floods damage was estimated in the tens of millions of dollars to crops and property, including a very great and irreparable loss of topsoil, through erosion. In addition to the destructive floods in most of the larger rivers and streams of the State, numerous flash floods occurred in the smaller streams and creeks following heavy to excessive local rains or breaks in levies. At Hannibal about 200 families were driven from their homes by a flash flood in Bear Creek

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 41)

following an excessive and heavy rainfall of 3.46 inches in approximately 17 hours on June 1st. At Poplar Bluff, low areas in the city and over the county were flooded following a heavy and excessive downpour of 2.62 inches in a period of about 45 minutes, between 6 and 7 p. m. on the 1st; a total of 3.24 inches occurred in less than 17 hours. Streets, basements and homes were flooded and gardens and crops in lowlands were destroyed or seriously damaged. Older residents report they could not recall a heavier rain in so short a period of time since the Poplar Bluff tornado of May 9, 1927. Damage, estimated at several thousand dollars, from this flash flood was not caused by Black River but from water running off the hills into the valleys.

A number of destructive storms, mostly of a local nature, occurred during the month and these are described in detail elsewhere in this issue.

The wet, cool weather during June was favorable for the wheat, oats and hay crops as well as pastures and all grasses and these made good progress and development over the entire State, except on bottom land where overflows and flood conditions prevailed, particularly over the northern half. Harvesting of wheat and barley was in progress in the southern half of the State the latter part of the month and a few early fields of oats had been cut by the close of June. However, frequent showers interfered with cutting and combining of these crops and the cutting and curing of the hay crop, with some losses to the latter crop. Most of the corn crop in the southern half of the State had been planted and cultivated once or twice by the end of the month, but over much of the northern half much corn remained unplanted and considerable replanting remained to be done at that time. Since most bottom lands along the larger streams and rivers in that area were flooded, or had been flooded and were not dried out sufficiently to be worked, much of that land would necessarily have to remain idle due to the lateness of the planting season for most crops. Most upland corn that had been planted during the month, or earlier, in the northern half of the State was becoming grassy and weedy from lack of cultivation which was delayed by the frequent rains and wet fields. The soybean crop was in about the same status as corn although there was still time for this crop to mature if fields became dry enough for planting soon after the close of the month. Cotton in the southeastern counties made fairly good growth and development during the month with chopping being completed and cultivation in progress, although cultivation was hindered by rains during the last week. Pastures were in very good condition throughout June and provided excellent grazing for livestock. The tomato crop was very promising in the southern portions of the State at the end of June. Fruit prospects, generally, continued very promising at that time, although later than normal. Warmer and drier weather was badly needed over most of the State, except the southwestern quarter, as the month closed.—M. R. W.

TEMPERATURE

The monthly mean for the State, 104 stations reporting, was 72.6°, or 1.0° lower than the 60-year June average. The highest monthly mean was 77.0° at Caruthersville, and the lowest was 67.8° at Unionville. The highest reported was 99° at Vandalia, on the 28th, and the lowest was 39° near Black, on the 14th.

PRECIPITATION

The average for the State, 210 stations reporting, was 8.19 inches, or 3.41 inches more than the 60-year June average. The greatest monthly amount was 23.60 inches at Lathrop, and the least was 1.72 inches at Birch Tree. The greatest amount reported in 24 hours was 5.65 inches at Lathrop on the 29th. The average number of days with 0.01 inch, or more, was 13. There was no snowfall reported.

MISCELLANEOUS PHENOMENA

Aurora.—13th; observed locally at Cuba.

Earthquake.—On 29th, at St. Louis and suburbs; light intensity.

Floods.—In Black River, at Leeper, on 28th; at Poplar Bluff, 16th to 30th. In Grand River, at Brunswick, continued from May into July; above Brunswick, at frequent intervals throughout the greater part of the month. In Meramec River, at Valley Park, on 28th and continued into July. In Mississippi River, in the reach from Keokuk, Iowa, to Dam No. 25, continued from May into July; in the reach from Grafton, Ill., to Cairo, Ill., June 5th and continued into July, except on the 10th and 11th at Cairo, Ill.; in the reach below Cairo, Ill., to Caruthersville, June 12th to 25th. In Missouri River, at Waverly and below, June 7th and continued into July, except at Boonville where the flood began on June 5th; in the reach from St. Joseph to Waverly, June 13th and continued into July; also, at St. Joseph on June 7th and at Waverly on June 4th. In Osage River, at Lakeside, June 28th and continued into July. In St. Francis River, at Fisk, on June 30th and continued into July.

Fogs.—Heavy, 3d, 4th, 7th, 19th, 20th, 25th, 26th.

Hail.—Light, 1st, at Martinsburg, Shelbina, Pierce City, Oregon, and near Oak in DeKalb County; 6th at Warrensburg and near Excelsior Springs; 17th, at Chillicothe Airport and Kirksville Airport; 18th, at Kidder, Maryville, and Tarkio; 25th, at Hannibal and Ferguson; 26th, at Columbia and Affton; 27th, at Lockwood, Monett, Springfield, and Rolla; 28th, at Chillicothe Airport and Farmington; 30th, at Fayette, Grant City, Caplinger Mills, Marshall, and Warrensburg. Moderate, 1st, at High Lookout; 6th, at Bethany and Edgerton; 27th, at Cassville, Oats Tower, and Harviell. Heavy, 1st, in Howell County; 30th, south of Browning. (See special storm table).

Tornadoes.—On 1st in Howell County; 4th, at Oak, DeKalb County; 6th, near Excelsior Springs; 27th, at Harviell; 30th, at Kingsville and Holden. (See special storm table).

Windstorms.—1st, 5th, 7th, 8th, 20th, 25th, 27th, 29th, 30th. (See special storm table).

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

ERRATA

November 1946, page 82: Date of minimum temperature at Bolivar should be 17. Number of days partly cloudy and cloudy at Boonville should be 5 and 15, respectively.

Date of greatest 24-hour precipitation at Lockwood should be 31-1. Date of maximum temperature at Saverton should be 15†.

Annual 1946, page 98: Number of days partly cloudy and cloudy at Boonville should be 98ᵃ and 118ᵃ, respectively.

Missouri Storms, June 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Howell	1	Between 3:40 p.m. and 4:15 p.m.	Tornado	W	¼ to ½	15	1	$20,000	Storm struck Olden, Pomona, Dripping Springs, White Church and Peace Valley communities, resulting in death of one person, serious injury to two others and damage to farm homes, buildings, outbuildings, timber, wires, orchards and fences estimated at approximately $20,000. Some livestock and poultry were killed. Heavy rain and in some areas heavy hail accompanied the storm. One hailstone was reported found that measured 7 inches around. Roads and highways were blocked by fallen trees.

Missouri Storms, June 1947—Continued from page 46

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
St. Louis City, St. Louis and Franklin	1	All forenoon and early afternoon	High wind and electrical storm	SW	....	....	0	$100	Generally high, gusty wind until about 2 p. m. Trees and wires were damaged by the wind in the St. Louis area; at Pacific, Franklin County, a child was slightly injured when blown against a barbed wire fence. During an electrical storm beginning in early evening, about 6 p. m., four buildings at St. Louis and in the County were struck and slightly damaged by lightning.
DeKalb...........	4	Between 10:45 p.m. and 11:00 p.m.	Tornado and high wind	SW	¼ to 2	4	0	$10,000	Storm struck near Oak, 7 miles northwest of Amity, damaging one house and several barns, outbuildings, trees and orchards. One person was slightly injured and several head of livestock and poultry were killed. Damage to crops in storage estimated at $100. Several trees were blown down and some outbuildings damaged by wind at Clarksdale in southwest corner of County. Light hail accompanied the storm near Oak.
Dade	5	7:00 a.m. to 7:15 a.m.	High wind	NW	150 to 200 feet	½	0	$3,000	Local windstorm struck the town of Lockwood with bulk of damage occurring in the business district. Roofs of three business buildings were blown off, two dwellings and numerous outbuildings were damaged and many trees felled or broken. Storm was accompanied by heavy rain which came in through the damaged roofs, accounting for about one-half of the damage. No one was injured.
Clay..............	6	8:08 p.m. to 8:14 p.m.	Tornado	WSW veering to WNW	200 yards to ⅜	2½	0	$100,000 to $125,000	Storm struck a short distance to the southwest and south of Excelsior Springs, passed through Crescent Lake and over Lake Maurer. Two or three houses were totally destroyed, a dozen or more partially destroyed as were a number of outbuildings. A large number of trees were also destroyed and some livestock killed. A great deal of damage occurred to telephone wires and to growing crops and gardens. A few persons were slightly injured.
St. Louis City and St. Louis..........	8	Between 1:00 a.m. and 2:00 a.m.	High wind and thunderstorm	S	....	....	0	$1,000	Power and telephone lines broken and service disrupted. Many limbs snapped from trees, and street light domes and a plate glass window were broken. Lightning struck a chimney of one building; also a church with resultant damage by fire of $1,000.
Holt..............	12	Early morning	Thunderstorm	......	....	....	0	Unknown	During an electrical storm, a barn 3 miles south of Forbes was struck by lightning and burned. A combine, feed grinder, 40 tons of hay and 6,000 bushels of corn were lost. Another barn burned 3 miles east of Oregon the same day but origin of the fire was undetermined. Some harness, hay, corn and oats were burned.
Sullivan..........	17	Morning	Electrical	......	....	....	1	Unknown	One man was struck and killed by lightning, a few miles southeast of Browning. Several head of livestock were also killed in the community.
St. Louis City and St. Louis	25	Between 7:00 p.m. and 7:45 p.m.	High wind and thunderstorm	NW	....	....	0	Minor	Numerous trees and public utility lines were blown down. A few hailstones fell in Ferguson.
Butler............	27	8:45 a.m. to 8:55 a.m.	Tornado	SW	100 yards	11	0	$10,000	Storm struck Harviell, and vicinity, damaging a number of business buildings, houses, barns and automobiles. Most of the town's telephone lines were blown down. No one was injured and no crop damage was reported. Storm was accompanied by heavy rain and moderate hail.
Greene & Webster.	27	6:00 a.m. to 6:30 a.m.	High wind	NW	5	30	0	$10,500	A high, line-squall wind of 56 miles per hour velocity struck Springfield, and vicinity, resulting in heavy damage to trees, power and telephone lines and minor damage to buildings and crops. One airplane and one automobile were badly damaged. Some evidence of a tornado was observed but if a tornado it was aloft and did not touch the ground. Damage at Springfield, and vicinity, was estimated at $10,000. At Seymour, and vicinity, trees and wires were broken and service disrupted. Damage estimated at $500 in that area. No injuries were reported from either area.
St. Louis City and St. Louis	29	Between 4:30 a.m. and 5:00 a.m.	High wind and thunderstorm	NW	....	....	0	Minor	Trees and wires were blown down and electric service for about six hundred families was disrupted. Some damage was reported to the wheat crop by the wind but extent of damage not known. Damage confined to southwestern section of city and southern part of County.
Marion............	30	Not known	Electrical	......	....	....	2	....	Two children were reported killed and a third injured when lightning struck a tree, in which they were playing, on a farm near Emerson.
Sullivan, Linn and Crawford..........	30	Between 11:25 a.m. and 12:25 p.m.; also 6:00 p.m.	High wind and heavy hail	SW	....	....	0	Not reported	High winds were quite general over the State on the 30th and resulted in considerable damage at several places. Near Browning, limbs were blown from trees and one old unoccupied house was blown down and some outbuildings damaged. South of Browning, but in Linn County, heavy hail accompanied the wind, damaging roofs and car tops and killing some frying chickens. Some stones measured 9½ inches in circumference. Linneus and Purdin communities were the hardest hit by the storm. At the latter place trees were damaged by the wind. At Cuba, Crawford County, trees and wires were damaged by wind at 6:00 p. m.
Boone	30	Between 1:10 p.m. and 2:15 p.m.	High wind	NW	2	10	0	$1,000 to $1,500	Storm occurred at Columbia and the vicinity south and southwest of that place, blowing down trees and wires and damaging some farm buildings and roofs. McBaine, Deer Park, Elkhurst and Nashville communities were the hardest hit by the storm. No injuries or crop damage reported.
Cass and Johnson .	30	Between 4:00 p.m. and 5:00 p.m.	High wind and tornado	WNW	¼	7	0	$60,000	Storm struck Kingsville and Holden communities, seriously injuring one person, destroying six residences, damaging fifteen others, a school building, and several barns and outbuildings, tore down trees and power and communication lines, and disrupted gas service when a "service gate" west of Holden was damaged. Bulk of damage was at Holden, but fortunately the storm missed the business districts of both towns. Approximately one hundred frying chickens were killed at Holden. Strong wind that damaged trees was reported at Strasburg, Cass County, preceding the tornado. Crops were destroyed in the path of the storm but damage to crops not estimated.
St. Louis City and St. Louis	30	Between 5:00 p.m. and 10:00 p.m.	High wind and thunderstorm	NW	....	....	0	Minor	High wind and lightning knocked down several power lines in the city and county. A trolley car was struck by lightning and the motor burned out, but no one was injured. A home in Wellston was struck by lightning which caused a small fire.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. LI — JULY 1947 — No. 7

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

The outstanding feature of July was the termination of the disastrous and, in some instances, unprecedented flood conditions that had prevailed since May or June in most of the larger rivers and streams of the State, and which resulted in tens of millions of dollars in property and crop damage and an irreparable and tremendous loss of top soil, by erosion. Flood crests were reached early in the month, but the major streams of the State were not entirely within their banks again until near the middle of the month.

It was the coolest month of its name since 1924 and the eighth-coolest July in the past 60 years. The minimum temperature of 39°, for this month, was the lowest ever recorded in the State during July. The previous low temperature was 40°, recorded in 1924, 1926, and 1944. The 19th, 22d, and 23d were, generally, the coolest days during the month, while the 30th and 31st were the warmest days. An unusually cool period prevailed from the 18th to the 25th, while the 26th to the end of the month was the only outstanding warm period during the month. The average temperature, with departures from normal, by divisions, was as follows: Northern, 74.6°, —2.3°; Southwestern, 75.4°, —2.4°; Southeastern, 75.1°, —3.2°; for the State, 75.0°, —3.0°. Afternoon temperatures of 100°, or higher, occurred on an average of only two days and were confined to the closing days of the month, which were not only hot, but quite humid as well, and some heat prostration cases were reported.

Average precipitation for July was 1.33 inches below normal and the distribution of the rainfall was very irregular, ranging from a total of 6.56 inches at Lockwood, the station receiving the greatest monthly total, to only 0.11 inch at Kahoka, where the least monthly amount was recorded. The greater portion of the month's rainfall occurred during the first week, as a rule, and by the end of the month conditions over the State, generally, were becoming progressively drier each day and more moisture was urgently needed as the month closed. Each of the three divisions of the State averaged considerably drier than normal, viz:—Northern, 1.97 inches, —1.61 inches; Southwestern, 2.43 inches, —1.12 inches; Southeastern, 2.10 inches, —1.27 inches; for the State, 2.17 inches, —1.33 inches. It was the driest month of the current year since February and the second-driest July since 1940, July of 1945 averaging drier than the current month.

There were no severe storms during the month, only a few local wind and thunderstorms being reported and these resulted in relatively minor damage. They are tabulated elsewhere in this issue.

July was the most favorable month since May for field work and the growth and development of all crops. After the first few days of the month, the unusually frequent and persistently heavy rainfall that had prevailed throughout June diminished in both frequency and quantity, and permitted the planting of crops that had not been previously planted and also the cultivation and harvesting of those crops that had been planted earlier. Planting and replanting of corn was completed by the middle of the month, although much land in the low bottoms

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 49)

that had been intended for corn, was necessarily planted to other crops, or remained idle due to the lateness of the season. Corn responded rapidly to the more favorable weather during most of July and to cultivation which was possible as fields became dry enough to permit this work, although it was too cool for best growth, as a rule, until the last week. However, the crop was later than normal and development varied greatly, ranging from tasseling stage to only a few inches high, the latter part of the month. Harvesting of small grains was mostly completed during the month and cutting of hay crops made very good progress, under favorable weather conditions. Yields of wheat were better than anticipated earlier, while oat yields were only fair to poor. Planting of the soybean crop was completed during the month, with considerable acreage originally intended for corn planted to this crop for hay and forage. Soy beans made very good progress during July and were in excellent condition at the end of the month. Pastures were generally in very good condition until the closing days of the month, when they, like most crops, were beginning to need more moisture. A good crop of early peaches and apples was being harvested during the latter part of the month and prospects were very favorable for a large crop of the later varieties. Cotton in the extreme southeastern counties made good progress and development the latter half of July, and was blooming as the month closed. It was too cool and wet, as a rule, for this crop during the first half of the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 104 stations reporting, was 75.0°, or 3.0° below the 60-year July average. The highest monthly mean was 78.8° at Kansas City Airport, and the lowest was 71.4° near Black. The highest reported was 108° at Birch Tree, on the 31st, and the lowest was 39° near Black, on the 23d.

PRECIPITATION

The average for the State, 210 stations reporting, was 2.17 inches, or 1.33 inches less than the 60-year July average. The greatest monthly amount was 6.56 inches at Lockwood, and the least was 0.11 inch at Kahoka. The greatest amount reported in 24 hours was 4.10 inches at Richwoods on the 1st. The average number of days with 0.01 inch, or more, was 5.

MISCELLANEOUS PHENOMENA

Floods.—In Grand River, at Chillicothe, continued from June to July 2d; at Brunswick, continued from May to July 13th and from July 15th to 16th. In Meramec River, at Pacific, 2d to 3d; at Valley Park, continued from June to July 8th. In Mississippi River, in the reach from Keokuk, Iowa to Dam No. 25, continued from May to July 14th; in the reach below Dam No. 25, continued from June to July 16th, except at New Madrid and below where flood prevailed only from July 6th to 10th. In Missouri River, continued from June to July 14th. In Osage River, at Osceola, on July 3d; at Lakeside, continued from June to July 3d and again on July 7th. In St. Francis River, at Fisk, continued from June to July 6th.

Fogs.—Heavy, 14th, 15th, 16th, 26th.

Hail.—Light, 5th, in portions of Audrain County; 6th, near Seymour; 14th, in south St. Louis and west St. Louis County.

Tornadoes.—None.

Windstorms.—5th, 12th, 14th, 28th. (See special storm table).

ERRATA

January 1947, page 2: Number of days with 0.01 inch of precipitation at Nevada and Seligman should be 2 and 3, respectively. Page 3: Mean temperature and departure at Sikeston should be 39.1 and +2.1, respectively. Mean temperature at Waynesville should be 35.0¶. Page 7: Mean maximum temperature at Sikeston should be 47.4.

February 1947, page 10: Number of days with 0.01 inch of precipitation at Butler should be 3. Mean temperature and departure at Canton should be 26.5 and −4.6, respectively. Page 11: Mean temperature at Willow Springs should be 31.1.

March 1947, page 18: Number of days clear, partly cloudy, and cloudy at Eldon should be 3[a], 18[a], and 9[a], respectively. Mean temperature at Ozark Beach should be 40.7.

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

Missouri Storms, July 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Audrain	5	Afternoon	High wind and electrical storm	NW	....	....	0	Unknown	Storm occurred at Mexico and vicinity. Trees and wires were blown down and broken, several farm buildings and outbuildings were damaged and windows of a few rural residences were broken. Some damage occurred to the oat, wheat and corn crops but amount of damage not reported. Light hail accompanied the storm with some stones ½ inch in diameter. Three buildings were struck by lightning but no serious damage resulted.
Miller	5	6:00 a.m.	Thunderstorm	......	....	....	1	Minor	A minister was killed when lightning struck a tent pole and set the tent afire at a religious camp meeting, 13 miles southwest of Eldon. Three women in another tent were shocked but not seriously injured by the bolt of lightning.
Nodaway	12	....	High wind	......	....	....	0	Minor	Wires and trees damaged at Maryville.
St. Louis City	14	Between 9:50 a.m. and noon	Wind and thunderstorm	NW	....	....	0	Minor	Some trees and wires were blown down and some shingles were ripped from roofs of a few buildings. Lightning damaged two power transformers and knocked down a tree. Light hail reported in St. Louis County and in south St. Louis.
Callaway	28	Between 6:00 a.m. and 9:00 a.m. and in afternoon	High wind and thunderstorms	NW	....	....	0	Considerable from lightning but minor from wind	Early morning thunderstorms accompanied by high wind damaged trees, wires and porches and lightning struck a home and two barns in the Fulton area, resulting in the destruction of one barn and contents of hay, feed, farming implements and harness. During the afternoon lightning struck another barn, 8 miles south of Fulton, burning it to the ground with loss of its contents of hay, feed, farm equipment and harness. Several head of livestock were destroyed by this thunderstorm.
Franklin	28	Between 7:00 a.m. and 8:00 a.m.	High wind	N	10	20	1	$2,000	Storm occurred over a strip 20 miles long and 10 miles wide extending from north to south of Gerald. Fruit trees were stripped of 25% of their fruits and some trees were uprooted and roofs of buildings damaged. Property loss estimated at $2,000 but damage to fruit not known. At Stanton, a man was killed by a falling tree during a windstorm at that place.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

Daily Temperatures for July 1947

VOL. LI AUGUST 1947 No. 8

PRICE: 5 CENTS A COPY: 25 CENTS A YEAR

GENERAL SUMMARY

Unusually hot and dry weather characterized the month of August and all growing crops suffered severely during the month over most of the State.

It was the hottest August since 1936 and the second hottest month of that name since State-wide records began in 1888. The hot weather was general over the whole State, every reporting station having a monthly mean temperature considerably higher than normal. The average temperature for the month, with departures from normal, by divisions, was as follows: Northern, 83.2°, +7.6°; Southwestern, 83.5°, +6.7°; Southeastern, 83.4°, +6.4°; for the State, 83.4°, +6.8°. The lowest temperature recorded anywhere in the State during the month was 56°, and this was the highest minimum temperature for any August in the past 60 years. Daytime temperatures were also unusually high during the month, there being an average of 28 days with a maximum temperature of 90°, or higher, and 8 days with 100°, or higher, for the State as a whole. A few stations had temperatures of 90°, or higher, on every day during the month. The only relatively cool period occurred on the 14th and 15th, when daily mean temperatures dropped to normal, or slightly below, at most, but not at all stations. During the remainder of the month daily mean temperatures were considerably above normal at all stations; on some days as much as 15° to 18° above the daily normal. As a result of these persistent and unusually high day to day temperatures there were many heat prostration cases reported and numerous fatalities occurred, particularly in the larger cities.

The month was the driest of its name since 1936 and the sixth-driest August in the past 60 years. This is in marked contrast to August one year ago, which was the third-wettest August of record (1888-1947). Precipitation this month was mostly of the summer thundershower type, being moderate to excessive over small areas while adjacent areas received none, or only light amounts. The frequency and distribution of the month's rainfall was irregular, occurring on 7 or 8 days at a number of stations and only on 2 or 3 days at some other stations. Monthly totals ranged from 6.33 inches at Ellington to only 0.08 inch at Warrenton. Most stations had considerably less than normal precipitation during the month, but a few stations, in each of the three divisions of the State, had monthly totals in excess of normal. The distribution by divisions, with departures from normal, follows: Northern, 1.30 inches, −2.43 inches; Southwestern, 1.85 inches, −2.07 inches; Southeastern, 2.28 inches, −1.51 inches; for the State, 1.81 inches, —2.00 inches. There were only two, more or less general, periods of precipitation during the month, the 13-16th and 25-26th; otherwise the rainfall was local and widely scattered. Supplies of water for both domestic use and for livestock became critically short during the month in many localities, and some municipalities, whose source of supply was from drilled wells, were forced to appeal for all possible conservation of water uses by the citizens. Many wells failed and small creeks and ponds dried up entirely or became very low during the month.

Sunshine for August averaged considerably more than normal, with an average of 19 clear days, for the State as a whole.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or, "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 57)

There were no floods this month in any of the streams or rivers of the State, the first month since February that flood stage, or above, had not occurred in at least one river. Daily stages in all rivers diminished gradually, as a rule, during the month and were at relatively low levels at the close of August.

Only a few local storms, of a damaging nature, occurred this month and these are listed in the accompanying storm table for August.

The hot, dry weather which prevailed throughout the month over most of the State, caused steady and serious deterioration of all growing crops and pastures, and resulted in the most severe drought since the great drought of 1936. Most of the corn crop was badly damaged, some beyond recovery, and hay crops and pastures were cut shorter and shorter as the month progressed. Cotton and soybeans withstood the drought and high temperatures better than other crops, but these also were adversely affected and damaged. Harvesting and threshing of small grains were completed early in the month and yields of wheat were better than expected, but the yield of oats was disappointing and poor. Gardens, truck crops, melons, and the commercial tomato crop in the southwest portion of the State were badly damaged and burned, and many new strawberry beds were severely damaged. Cutting and curing of hay continued during the month with little interruption from showers, but the prevailing high temperatures were very uncomfortable for both man and beast. All fruits and berries were adversely affected by the drought and hot weather and many apples dropped off the trees. However, a fairly good crop of apples, peaches, pears, and grapes was indicated at the close of the month.

While the more or less general rains of the 13-16th and 25-26th afforded some temporary relief, unusually hot weather continued throughout the remainder of the month and minimized the affect of these rains. As the month closed a general soaking rain and much cooler weather were badly needed for all vegetation and crops and to replenish dwindling water supplies.—M. R. W.

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 83.4°, or 6.8° warmer than the 60-year August average. The highest monthly mean was 86.2° at Kansas City Airport, and the lowest was 79.3° near Black. The highest reported was 109° at Carthage on the 31st and the lowest was 56° at Elsberry on the 1st.

PRECIPITATION

The average for the State, 210 stations reporting, was 1.81 inches, or 2.00 inches less than the 60-year August average. The greatest monthly amount was 6.33 inches at Ellington, and the least was 0.08 inch at Warrenton. The greatest amount reported in 24 hours was 4.60 inches at Lockwood on the 26-27th. The average number of days with 0.01 inch, or more, was 5.

MISCELLANEOUS PHENOMENA

Fogs.—Heavy, 8th, 13th, 16th, 17th, 27th.

Hail.—Light, 25th at Farmington and Ferguson; 26th at Lockwood.

Windstorms.—20th, 24th, 25th. (See special storm table).

VOL. LI — SEPTEMBER 1947 — No. 9

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

Severe drought and high temperatures prevailing at the close of August continued well into September, resulting in further deterioration of all growing crops and pastures. The month averaged both hotter and drier than normal, for the State as a whole.

It was the hottest September since 1939 and the ninth-warmest month of that name in the past 60 years, and averaged 3.9° warmer than September a year ago. The first three weeks of the month averaged considerably warmer than normal, as a rule, while the last week averaged cooler than normal. The 3d, 4th, 7th, and 8th were the hottest days of the month and the 23d and 30th were the coolest days, generally. The extreme maximum for the State this month was 109°; this mark has been exceeded only once during September, in 1925, and equalled twice, in 1913 and 1936, since State-wide records began in 1888. There were no freezing temperatures reported during the month, except near Black, where a minimum of 31° occurred, and no damaging frosts were reported anywhere in the State. However, light frost formed, locally, at a number of stations on several nights during the latter part of the month. Maximum temperatures of 100°, or higher, and 90°, or higher, occurred on an average of 3 and 13 days, respectively, for the State as a whole. Average temperatures, with departures from normal, by divisions, were: Northern, 71.0°, +3.3°; Southwestern, 73.0°, +3.0; Southeastern, 71.8°, +1.7°; for the State, 71.9°, +2.6°.

Precipitation during September was infrequent and unevenly distributed over the State, ranging from a total of 7.96 inches at Nevada to only 0.69 inch at Tarkio. The first 10 days of the month were generally hot and dry and without rain, except for a few local showers on the 3d-4th, principally over the Northern Division. Rather general and very beneficial showers occurred on the 11-12th, temporarily relieving the damaging effects of the severe drought. Moderate to heavy rains occurred over most of the State on the 20th-21st, except the extreme northwestern corner, as a low pressure system, which was the remnant of an intense hurricane, passed over the southern portion of the State and brought much needed and welcomed relief from the severe drought and hot weather that had prevailed since late July. The critical shortage of water in many localities was also greatly relieved, but not adequately replenished, by this period of precipitation and vegetation and crops, generally, took a new lease on life. The bulk of the month's rainfall fell during this latter period, as a rule. The average precipitation, by divisions, with departures from normal, were as follows: Northern, 3.87 inches, —0.32 inch; Southwestern, 4.33 inches, +0.04 inch; Southeastern, 3.28 inches, —0.36 inch; for the State, 3.83 inches, —0.21 inch.

There were no floods in the State during September and it was the second consecutive month without a flood in any river. Daily river stages throughout the month were rather low, as a rule, for this time of year.

Only three small local storms, resulting in damage, occurred during the month and these are tabulated in detail in the accompanying storm table.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 65)

All crops and grasses continued to suffer from the prolonged hot, dry weather the first 10 days of the month. On the 11-12th rather general and beneficial showers brought temporary relief from the drought, but unusually warm weather continued until the 20-21st, when both the heat and droughty conditions were greatly relieved, over most of the State, by general and generous amounts of rain, and the lower temperatures which continued throughout the remainderof the month. All growing crops and pastures responded rapidly to the fine rain and the cooler weather and showed remarkable improvement by the end of the month. However, much damage had already been done to corn, soybeans, cotton, and lespedeza fields and ultimate yields from these crops, it seemed, would be cut short. One favorable feature of the month's weather was the absence of damaging frosts, or freezing temperatures. A hard freeze or killing frost would have been very disastrous, due to the fact most crops had been planted later than usual, because of continued wet weather during the spring and early summer months. The bulk of the corn crop was safe from frost damage by the end of September, but much of the later planted corn was still not out of danger at that time. Considerable corn was cut for silage, or shocked, and some picking had begun by the end of the month. Soybeans were also damaged considerably by the drought and, since much of the crop was planted late, a large portion was expected to be cut for hay, since time was getting short for much of the crop to mature sufficiently to be harvested for grain. Cotton, too, suffered and yields were cut short by the hot, dry weather; bolls were opening and picking had begun late in the month. Pastures and late gardens were revived and improved greatly during the latter part of September. Fall plowing was being done during the latter part of the month and a small amount of wheat, rye, and barley was sown. Harvesting of late apples was under way, as the month closed, but a heavy drop of the crop, due to the prolonged hot and dry weather, reduced the yield. A good crop of late peaches was picked during the first half of the month; the quality however was affected by the drought. More rain was needed as the month ended, to keep the ground in good condition for plowing and seeding of fall crops, to keep grass, pastures, and late gardens growing and in good condition, as well as to further increase the low water supplies in many areas of the State.—M. R. W.

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 71.9°, or 2.6° warmer than the 60-year September average. The highest monthly mean was 75.0° at Joplin Airport, Lockwood, Warsaw and Caruthersville, and the lowest was 67.8° near Black. The highest reported was 109° at Kansas City Airport on the 3d and at Union on 4th, and the lowest was 31° near Black on the 23d.

PRECIPITATION

The average for the State, 208 stations reporting, was 3.83 inches, or 0.21 inch less than the 60-year September average. The greatest monthly amount was 7.96 inches at Nevada, and the least was 0.69 inch at Tarkio. The greatest amount reported in 24 hours was 6.06 inches at Shelbina on the 20-21st. The average number of days with 0.01 inch, or more, was 5.

MISCELLANEOUS PHENOMENA

Auroras.—3d, 13th, 14th, 22d, 23d, 24th, 25th.

Fog.—Heavy, 10th.

Frost.—Light, 16th, 22d, 23d, 24th.

Hail.—Moderate, 11th at Fulton; heavy, 11th in eastern Mercer County. (See special storm table).

Tornadoes.—11th. (See special storm table).

Windstorms.—4th. (See special storm table).

ERRATA

April 1947, page 26: Number of days with 0.01 inch or more of precipitation at Jefferson City should be 17.

May 1947, page 34: Mean temperature and departure at Warrensburg should be 63.6 and − 1.4, respectively. Page 39: Mean minimum temperature at Warrensburg should be 52.0^{a}.

Missouri Storms, September 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Putnam	4	2:00 a.m. to 3:00 a.m.	Windstorm	SW	4	....	0	Small	Storm struck the southeastern part of the county and extended to the northern edge of Graysville. Some trees were damaged and several window panes broken and a lot of things were blown over. Nearly all haystacks in the path of the storm had their tops blown off or were blown down completely. Freakish hot gusts of wind preceded the storm.
Mercer and Putnam	11	Early morning before dawn	Tornado	NW	7 to 10	22	0	Unknown	Storm struck the eastern part of Mercer and the western part of Putnam Counties, resulting in considerable property and crop damage. Numerous homes, barns, outbuildings, trees, wires, and a few windmills were damaged or blown down and most haystacks in the storm path were blown down or had their tops blown off and hay was scattered over the fields and roads. Considerable damage was done to corn and soybeans by hail which accompanied the storm. Bulk of the total damage occurred in Mercer County where the towns of Cleopatra and Ravanno were hit by the storm. Crop and property damage was not estimated in reports received on this storm.
Callaway	11	11:10 a.m. to 11:25 a.m.	Tornado	SW	1	5 or 6	0	$10,000	A small local tornado struck the vicinity a few miles south and east of Fulton, damaging a number of homes, barns, outbuildings, trees, and wires and killed some poultry. Moderate hail accompanied the storm and damaged corn and gardens. Stones were from 1 to 1½ inches in diameter. Crop damage was estimated at $1,000. Driving rain also accompanied the storm and was blown into homes causing much damage.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. LI OCTOBER 1947 No. 10

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

October was an unusually warm month, over the whole State, and highly favorable for curing and harvesting of all crops. The only damaging frosts, or freezing temperatures, reported in the State during the month, were in the extreme northwestern corner, and practically all crops reached maturity, despite the fact many of these were planted unusually late.

It was the warmest October in the past 60 years and the State average temperature of 65.2° was only 4.1° lower than the normal for September. Daily temperatures averaged warmer than normal, at most stations, nearly every day during the month, except the first day or two and also for a day or two during the last week, when the daily averages were below normal, at some stations. The period from the 6th to 25th was particularly warm, averaging from 10° to 20° degrees warmer than normal, as a rule. Maximum temperatures during the month occurred on the 5th, 7th, 13th and 14th, when afternoon readings in the low to middle 90's were registered. The 1st and 29th were generally the coolest days, when minimum temperatures for the month were in the 30's, except at Tarkio where a low of 29° was recorded on the latter date. The Southwestern Division had the highest monthly average temperature of 66.3°, or 8.0° warmer than normal. The averages, with departures from normal, for the Southeastern and Northern divisions were 65.3°, +6.7° and 63.9°, +7.7°, respectively; for the State as a whole, 65.2°, +7.3°.

Precipitation during October was all in the form of rain, no snow being recorded anywhere in the State. The distribution over the State was rather irregular, ranging from a total of 7.87 inches at Vichy to only 0.83 inch at Granby. The greater portion of the month's rainfall occurred during the last week, as a rule, and it was this period of general and copious rainfall that finally broke up the severe drought that had prevailed over most of the State since the latter part of July. Prior to the 23d the precipitation, during October, was mostly from scattered, local showers, occurring principally from the 1st to 4th and on the 17-18th. Although the month averaged 0.87 inch above normal precipitation, it was considered a dry month from an agricultural viewpoint. Average precipitation by divisions, with departures from normal, were as follows: Northern, 3.56 inches, +0.88 inch; Southwestern, 3.08 inches, —0.06 inch; Southeastern, 4.86 inches, +1.81 inches; for the State, 3.83 inches, +0.87 inch.

No floods occurred in any of the rivers of the State and daily river stages were, generally, quite low for the time of year, throughout the month.

Sunshine averaged considerably in excess of normal during the month, particularly the first three weeks, and the average number of clear days, for the State as a whole, was 18.

Only one damaging hail storm was reported during the month. (See storm table for details). However, there was some minor damage from lightning, that occurred in connection with local thunderstorms at Amity on the 23d; at St. Louis on the 24th; at Rolla on the 25th and at Boonville on the 30th.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Eastwood Lookout is Van Buren; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 73)

Unprecedentedly warm weather and the absence of a killing frost or freezing temperatures, except locally at Tarkio, during October, permitted practically all crops to reach maturity. Harvest of the corn, cotton, and soybean crops was under way throughout the first three weeks of the month, under nearly perfect weather conditions, but harvesting was interrupted by general rains the last week of the month. Plowing for and the seeding of small grains made rapid progress until the last week of October, when these activities were also curtailed by rain. By the close of the month most of the acreage intended for wheat, barley and rye had been seeded and these crops were up to good stands and making very good growth; some early sown fields were being grazed. The condition of pastures improved considerably during the first and last weeks of the month, but it was too dry, generally, during the middle of the month for much growth. Cotton matured satisfactorily during the month and picking was well along by the close. A large crop of late apples was being picked and marketed throughout the month. Alfalfa made good growth early in the month and some fields were cut for hay. The fine rains during the last week of October not only ended the long and severe drought, but also replenished short water supplies in practically all areas of the State, at least temporarily. Due to the prevailing high prices and world shortage of all grains, and the prospect of these prices being maintained, a rather large acreage of small grains, especially wheat, was sown this fall, much of it before fly-free dates. This practice usually entails a risk of future damage to the crop by the Hessian fly. Livestock were in good condition and were able to forage in fields and pastures throughout the month and dry feeding was thus reduced to a minimum.—M. R. W.

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 65.2°, or 7.3° warmer than the 60-year October average. The highest monthly mean was 68.4° at Joplin Airport, and the lowest was 60.8° at Unionville. The highest reported was 94° at Anderson on the 5th, and the lowest was 29° at Tarkio on the 29th.

PRECIPITATION

The average for the State, 211 stations reporting, was 3.83 inches, or 0.87 inch more than the 60-year October average. The greatest monthly amount was 7.87 inches at Vichy, and the least was 0.83 inch at Granby. The greatest amount reported in 24 hours was 3.98 inches at St. Louis City Office on the 24-25th. The average number of days with 0.01 inch, or more, was 7. There was no snowfall reported anywhere in the State.

MISCELLANEOUS PHENOMENA

Fog.—Heavy, 3d, 4th, 5th, 8th, 9th, 12th, 13th, 14th, 18th, 24th, 25th, 26th, 27th, 28th, 29th, 30th, 31st.

Frost.—Light, 10th, 19th, 29th.

Hail.—Light, 4th at Sikeston and West Plains; 17th at Neosho and Parma; 27th west of Waynesville; 30th at Pleasant Hill and Warrensburg. Moderate, 4th at High Lookout. Heavy, 17th at De Soto. (See special storm table).

Sleet.—27th.

Windstorms.—No damaging windstorms reported.

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

Missouri Storms, October 1947

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Jefferson	17	About 4:00 p.m.	Heavy hail	W	1	1	0	$4,000	Storm occurred at De Soto, resulting in damage to many composition shingle roofs, greenhouse glass and late gardens. Stones were mostly ⅜ to ½ inch in diameter with a few as large as golf balls. The north half of the town was hardest hit. Heavy rain accompanied the hail which lasted about 30 minutes.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

November was a rather cold, cloudy, damp, and disagreeable month with unusually frequent precipitation.

It was the coldest November since 1937 and averaged 6.0° lower than the average for November a year ago. Except for a few days at the beginning of the month and an occasional day or two at infrequent intervals thereafter, daily average temperatures were below normal. However, no unusually low temperatures were recorded at any time during the entire month, the extreme lowest for the State being only 9°. Likewise, there were no unusually high temperatures during November. The 6th was the warmest day and the 30th the coldest during the month, as a rule. The first general killing frost and hard freeze occurred on the 8th, bringing to a close an unusually long growing season for most stations. However, some stations in the more southern portions of the State did not have a killing frost until the 11th or 12th, or even later. Average temperatures for the month, by divisions, with departures from normal were as follows: Northern, 37.8°, —4.4°; Southwestern, 42.2°, —3.7°; Southeastern, 43.1°, —2.9°; for the State, 41.0°, —3.4°. Not a single individual station had a monthly mean temperature normal, or above, during the month.

Precipitation during November was quite frequent and occurred as both rain and snow, but mostly in the form of rain. The snowfall this month was of little consequence, except at a few northernmost stations. As a rule, the snow melted quickly, except where the heavier falls occurred and there it covered the ground for four or five days at a time at a few stations. Many stations in the southern half of the State reported no snowfall, while only a very few stations in that area reported more than a trace, during the month. Distribution of the month's precipitation was quite irregular, ranging from a total of 5.92 inches at Caruthersville to 1.26 inches at Waynesville. The distribution by divisions, with departures from normal, was as follows: Northern, 2.22 inches, exactly normal; Southwestern, 2.27 inches, —0.39 inch; Southeastern, 3.47 inches, +0.21 inch; for the State, 2.65 inches, —0.06 inch. Some stations reported measurable precipitation on as many as 14 or 15 days during the month, particularly in the Southeastern Division. The State average was 11 days, or 5 days more than normal for November.

Sunshine was decidedly deficient this month with an average of 15 cloudy days, for the State as a whole.

There were no floods in any of the larger streams or rivers of the State and no damaging storms worthy of special mention were reported.

The cold, cloudy, damp weather during most of November was generally unfavorable for seasonal outdoor activities, and alternate thawing and freezing and frequent precipitation delayed and hampered the work of getting crops out of the fields. Wheat seeding was mostly completed early in the month and a larger acreage than usual was sown to that crop this fall. The frequent precipitation and absence of unusually low temperatures were very favorable for wheat and permanent pastures,

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 81)

and both made very good growth throughout most of the month. There were some reports of Hessian fly infestation in early-sown wheat that had made very rank growth but the first hard freeze stopped the threat and checked too rank a growth. Soybean harvest was practically completed as was the harvesting of lespedeza seed by the close of the month. Water supplies and soil moisture were ample for current needs during the month. Livestock, generally, were in good condition but soft and muddy fields prevented grazing much of the time and dry feeding became increasingly more necessary as the month progressed. Considerable corn and some cotton still remained in the fields as the month closed.—M. R. W.

TEMPERATURE

The monthly mean for the State, 107 stations reporting, was 41.0°, or 3.4° below the 60-year November average. The highest monthly mean was 48.4° at Caruthersville, and the lowest was 34.0° at Unionville. The highest reported was 73° at Anderson on the 4th and 6th and at Carthage and Ozark Beach on the 6th, and the lowest was 9° at Maryville on the 24th and at Canton, Elsberry, Trenton and Unionville on the 30th.

PRECIPITATION

The average for the State, 213 stations reporting, was 2.65 inches, or 0.06 inch less than the 60-year November average. The greatest monthly amount was 5.92 inches at Caruthersville, and the least was 1.26 inches at Waynesville. The greatest amount reported in 24 hours was 1.91 inches at Sikeston on the 14th. The average number of days with 0.01 inch, or more, was 11.

Snowfall averaged 0.5 inch, or 0.5 inch less than the 58-year November average. The greatest monthly snowfall reported was 7.7 inches at Unionville.

MISCELLANEOUS PHENOMENA

Fogs.—Heavy, 4th, 6th, 12th, 19th, 22d, 26th, 27th.

Frosts.—Light, 5th, 6th, 8th, 9th; heavy, 6th, 7th, 8th, 9th; killing, 5th, 6th, 7th, 8th, 9th, 11th, 12th, 16th, 25th.

Glaze.—10th, 21st, 22d, 23d, 24th.

Hail.—Light, 4th at Chillicothe Airport, Martinsburg, Jefferson City; 6th at Albany, Warrenton, Bolivar, Joplin. Heavy, 10th at Pomona and vicinity; practically no damage.

Sleet.—7th, 9th, 10th, 18th, 19th, 21st, 22d, 23d, 24th, 25th, 27th, 28th, 29th.

Windstorms.—High winds on several days but no damaging windstorms reported.

VOL. LI — DECEMBER 1947 — No. 12

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

December averaged considerably warmer and slightly drier than normal. It was a favorable month for seasonal outdoor activities.

The mild weather during the month was state-wide, all three divisions of the State averaging 3° to 4° warmer than their respective normals, and all but two individual stations had a monthly average temperature higher than normal. The Southeastern and Southwestern divisions had the highest averages with 39.3° and 39.2°, respectively; these averages are 3.0° and 4.0°, respectively, warmer than normal for those divisions. The average for the Northern Division was 34.7°, or 4.0° warmer than normal. Extremes of temperature for the month were well within the all-time records established in past Decembers. No zero, or below, temperatures were recorded this month, the lowest reported being only 7°, which is the second highest minimum temperature for December in the past 61 years. In December 1931 the minimum temperature was 11°. In only eight of the past 61 Decembers has the temperature failed to drop to zero, or below, at some place in the State. The 7th, 8th, and 29th were the warmest days during the month, while the 12th, 13th, and 16th were the coldest days, as a rule. Warm periods occurred from the 1st to 7th, 17th to 22d and 26th to 31st, while the only extended cold period occurred from the 8th to the 13th, generally.

Precipitation occurred in practically all of its varied forms, at different times during the month, but rain constituted the greater part of it. The distribution of the month's precipitation was very irregular, ranging from a total of 6.12 inches, near Alton, to only 0.18 inch at Waynesville. There was very little precipitation after the middle of December, until the 31st, when a general rain, that turned to glaze, sleet and snow, began and continued into January. Extensive damage to trees, and power and communication lines resulted from this glaze and sleet storm, but since it extended into January details will be presented in the January issue of this publication. Snowfall during December was relatively light, particularly over the Southwestern Division, where the average for the month was only 0.4 inch. Several stations in that area reported no snow during the month. Heaviest falls occurred over scattered areas of the Northern Division and over much of the Southeastern Division, except the northwestern and extreme southeastern portions of the latter division. The snow melted rather quickly and the ground was not covered for more than a few days, after the 9th, at any place. Rather heavy to excessive amounts fell within a 24-hour period on the 3d-4th at a number of stations in the Northern and Southwestern divisions, and over the southeastern half of the State on the 31st. At Kansas City Airport, 2.75 inches fell within 24 hours on the 3d-4th, establishing a new record there for that period of time, in December. The average precipitation by divisions, with departures from normal, for the month, were as follows: Northern, 2.11 inches, +0.52 inch; Southwestern, 1.28 inches, —0.77 inch; Southeastern, 2.12 inches, —0.76 inch; for the State, 1.84 inches, —0.33 inch.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period: for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 89)

Except for the sleet and glaze storm mentioned above, there were no damaging storms reported during the month. However, high winds occurred on several days, but without doing any damage.

There were no floods, or high water, in any of the major streams of the State, except in the Grand River, at Chillicothe, where a strong rise occurred on the 4-5th, but bankfull stages were not reached.

Sunshine during December averaged only slightly more than normal. The average number of clear days, for the State as a whole, was 13.

The mild, open weather was very favorable for the winter wheat crop, which continued in very good condition and provided much grazing for livestock during most of the month. Permanent pastures also were in good condition throughout most of the month and lack of snow cover permitted livestock to forage these pastures and stalk fields, resulting in a considerable saving of dry feed and labor. Considerable plowing was accomplished during December, especially in the southern half of the State. Gathering of corn and cotton progressed throughout much of the month and most of the latter crop was out of the fields by the close. Some of the drier areas in the Southwestern Division reported a shortage of water during the month, but this condition was relieved, for the most part, by the generally heavy precipitation on December 31st-January 1st.—M. R. W.

TEMPERATURE

The monthly mean for the State, 107 stations reporting, was 37.7°, or 3.5° warmer the 60-year December average. The highest monthly mean was 44.0° at Caruthersville, and the lowest was 30.6° at Unionville. The highest reported was 73° at Ozark Beach on the 8th and at Nevada on the 29th, and the lowest was 7° near Black on the 16th.

PRECIPITATION

The average for the State, 215 stations reporting, was 1.84 inches, or 0.33 inch less than the 60-year December average. The greatest monthly amount was 6.12 inches near Alton, and the least was 0.18 inch at Waynesville. The greatest amount reported in 24 hours was 3.87 inches at West Plains on December 31st-January 1st. The average number of days with 0.01 inch, or more, was 5.

Snowfall averaged 1.1 inches, or 2.4 inches less than the 58-year December average. The greatest monthly snowfall reported was 6.0 inches at Cape Girardeau.

MISCELLANEOUS PHENOMENA

Earthquake.—Light, on 1st; felt in the Poplar Bluff area; no damage.

Fogs.—Heavy, 3d, 4th, 9th, 11th, 12th, 13th, 14th, 17th, 19th, 20th, 21st, 22d, 23d, 24th, 25th.

Glaze.—3d, 4th, 9th, 10th, 23d, 31st.

Hail.—Light, on 4th at Kirksville and on 31st at Greenville.

Sleet.—3d, 4th, 6th, 7th, 9th, 10th, 15th, 22d, 24th, 31st.

Windstorms.—High winds reported on several days but no damaging windstorms were reported.

ERRATA

November 1947, page 81: Degree days at Springfield should be 700. Page 82: Mean temperature and departure at Springfield should be 41.8 and −3.2, respectively. Page 87: Minimum temperature on 29th at Springfield should be 23 and mean minimum should be 34.0.

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. (C) Airport. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for December 1947

(See precipitation data in daily precipitation table)

VOL. LI ANNUAL SUMMARY 1947 No. 13

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

Although the annual mean temperature and the average precipitation for the State were practically normal, those figures are misleading, for it was a year of marked extremes from several weather standpoints. Beginning with January, though it was a warm and rather dry month, Tarkio and Bethany reported the lowest temperature (−28°) for the State since January 1940. February was not only the driest of record (0.26 inch), but the driest month of any name except November 1904 (0.22 inch). March was the coldest since 1915 and the snowfall average, 8.8 inches, was unusually high. April was plagued by high winds, frequent thunderstorms, tornadoes, hail and prolonged floods. It was the fourth-wettest April of record, and as a result farm work was three to four weeks behind the normal as that month closed. A tornado on April 29th passed through the town of Worth, in the extreme northwestern section of the State, killed 14 persons, injured between 40 and 50 others, some seriously, demolished the business section and destroyed or damaged practically every home, or other structure, in the town. Damage was estimated at close to three quarters of a million dollars. A smaller tornado earlier the same month caused damage to the extent of $200,000 at Eldorado Springs, Cedar County. There were no fatalities, however.

May was a favorable month for crop growth and field work and there was only one storm causing material damage. An 18-year old boy was struck and killed by lightning on the 31st, while driving a tractor on a farm near Atherton, in Jackson County. June will long be remembered for its disastrous floods, in some cases unsurpassed, and for the unprecedented rainfall that occurred over the northern half of the State. In the Mississippi River, from Keokuk, Iowa, to Dam No. 25, the highest stages of record were reached, while at St. Louis the highest stage in 103 years was recorded on the closing day and the crest, 40.26 feet, was reached on July 2d. New record-high stages were also reported in June, at some stations in the Grand watershed. Flood damage aggregated many millions of dollars, in the State of Missouri. Numerous flash floods occurred on smaller streams and creeks during June, and one on Bear Creek drove about 200 families from their homes in, or near, Hannibal. At Poplar Bluff, in the same month, an excessive downpour of rain, i.e., 2.62 inches in a period of about 45 minutes, caused the flooding of low areas in that town, as the rain ran off the hills into the lower places. Streets, basements and homes were flooded and gardens and crops in the lowlands were either seriously damaged or destroyed; the flooding also extended to County areas surrounding Poplar Bluff. Lathrop, in Clinton County, had a total of 23.60 inches of rain for June, a monthly amount previously exceeded only by the 25.54 inches total at Joplin in May 1943, while the average for the Northern Division, 12.00 inches, set a new record-high for that section of the State. A man was killed by lightning near Browning on June 17th, and two children were killed near Emerson on the 30th. July was the coolest since 1924, but August following was unusually hot, as well as dry. In fact it was the second-hottest August of record, exceeded only by that of 1936, and driest month of this name since 1936. The most

(Continued from page 97)

severe drought since 1936 prevailed at the close of month, with serious deterioration of crops, including pastures. Many heat prostrations were reported, with numerous fatalities occurring, especially in the larger cities. Supplies of water, for both domestic use and for livestock, became critically short during the month and some municipalities, whose sources of supply were drilled wells, were forced to appeal for all possible conservation of water uses by the citizens. Many wells failed and many small creeks and ponds dried up entirely. The drought continued well into September, which proved to be the warmest since 1939. However the critical shortage of water was relieved in many localities by rain on the 20th-21st, and vegetation generally took on a new lease on life.

October proved to be a most favorable month, with mean temperature the highest of record, and copious, general rains during the last week, finally broke the drought that had persisted over much of the State since the latter part of July. Conditions were highly favorable for curing and harvesting all crops. November was the coldest in ten years, and on the whole, a cloudy, disagreeable month. However, no unusually low temperatures were recorded, the cold being of the persistent type. The first general killing frost of the season occurred on the 8th, thus bringing to a close an unusually long growing season for most stations. Unlike November, December was considerably warmer and slightly drier than normal, and a most favorable month for seasonal outdoor activity.

Tornadoes were reported in January, April, May, June and September, the toll in lives lost being 21, while more than 80 persons were injured and property damage was in excess of one million dollars. Windstorms caused additional property damage of more than $200,000, and resulted in death of one person and injury to 15 others, while hail damage this year was in excess of $28,000. A minister was killed by lightning in the month of July near Eldon, and thus brought the total meeting death in that manner to 5 for the year 1947.

TEMPERATURE

The annual mean temperature for the State was 55.4°, which is 0.2° above the 60-year average. The highest annual mean was 60.5° at Caruthersville, and the lowest annual mean was 50.1° at Unionville. The highest temperature recorded was 109° at Carthage, on August 31st, and at Kansas City Airport Station, on September 3d; also at Union on September 4th. The lowest reported was 28° below zero at Bethany and Tarkio on January 4th.

PRECIPITATION

The average annual precipitation for the State, 39.84 inches, was 0.65 inch less than the 60-year normal. The greatest annual amount was 60.67 inches at Lathrop, and the least annual amount was 27.07 inches at Seligman. The greatest local monthly amount was 23.60 inches, at Lathrop, in June; no precipitation was recorded at Madison, Palmyra, Perry and Shelbyville during the month of February, while a number of other stations had only a Trace. The greatest amount in any 24 consecutive hours was 6.06 inches, at Shelbina, on September 20th-21st. The average number of days with 0.01 inch, or more, was 94.

The average annual snowfall for the State was 17.4 inches, or only 0.2 inch less than the 54-year average. The greatest annual amount was 36.7 inches at Oregon, and the least annual amount was 1.0 inch at Bernie. The greatest monthly snowfall was 26.0 inches at Mexico in March.

VOL. LII JANUARY 1948 No. 1

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

January was a cold month with more snow than had fallen in any month of that name since 1940. It brought the first real extended winter weather of the current winter and the most severe ice and sleet storm since December 1924.

It was the coldest January since 1940 and the 13th coldest month of that name in the past 61 years. Although the high and low extremes of temperature were not unusual, as extremes go, the daily averages were below normal the first two or three days and during the latter half of the month, as a rule; from the 4th to the 15th daily averages were generally above normal. All three divisions of the State, as well as each individual station, averaged colder than normal, viz:—Northern, 22.2°, —4.3°; Southwestern, 27.2°, —4.8°; Southeastern, 27.8°, —6.1°; for the State, 25.7°, —5.2°. The usual January thaw did not occur this month, the coldest weather of the winter, to date, prevailing at the time this phenomenon usually occurs during January.

Precipitation during the month was from a combination of rain, sleet, and snow, the latter form being quite heavy over the northwestern quarter of the State and moderately heavy over scattered areas of the Southwestern and Southeastern divisions. On the 1st heavy snow, high wind and blizzard conditions prevailed over the more northern counties of the State, and badly drifted the snow and blocked roads and highways and generally tied up traffic in that area. At Unionville a total of 17 inches of snow fell during this storm and many other stations in that area reported snowfall of 8 inches or more on the 1st. At the same time the remainder of the State, except the more southern counties and most of the Southeastern Division, was in the grip of a severe glaze and sleet storm that turned to snow and which is described in the special storm table elsewhere in this issue. Snow covered the ground throughout the month at a number of stations in the extreme northern portion while elsewhere over the State the ground was covered only during the first few days of the month and again the last 10 days or so, quite generally. Distribution of the monthly precipitation was very irregular, ranging from a total of 5.73 inches near Annapolis to only 0.25 inch at Joplin Airport and 0.27 inch at Tarkio. The Southeastern Division received the most precipitation during January, with an average of 3.39 inches, or 0.16 inch more than normal; the averages and departures from normal for the Southwestern and Northern divisions were 1.89 inches, —0.20 inch and 1.43 inches, —0.16 inch, respectively. The bulk of the monthly total at most stations occurred on the first day of the month, as a rule.

Damaging storms were confined to the first day of the month and are described in the special storm table of this publication.

Minor floods occurred in the Black, Meramec and St. Francis rivers early in the month, following heavy rains over the drainage basins of those rivers on December 31-January 1st. During the latter half of the month most of the smaller rivers and streams of the State were frozen over, while the major rivers were affected by ice conditions.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 1)

Very little field work was accomplished during the month, except in the more southern counties of the Southeastern Division where some plowing was done and some cotton was picked during the mild weather that prevailed most of the first half of the month. Wheat apparently withstood the ice and sleet storm without any serious effects and it was in good to excellent condition at the close of the month although dormant and frozen. Over most of the State an adequate snow cover protected the wheat crop during the cold weather the last ten days of January. Livestock were in feed lots and on dry feed throughout most of the month, very little grazing or foraging being possible because of muddy or snow-covered fields and pastures. Low temperatures the latter part of the month, particularly in the northern half of the State, were believed to have damaged peach buds. A serious shortage of water supplies was reported from some localities in the Southwestern Division, while most of the State was becoming rather dry and more moisture was needed to replenish water supplies, generally, as the month closed.—M, R. W.

TEMPERATURE

The monthly mean for the State, 106 stations reporting, was 25.7°, or 5.2° below the 61-year January average. The highest monthly mean was 32.8° at Caruthersville, and the lowest was 17.6° at Unionville. The highest reported was 73° at Ozark Beach on the 8th, and the lowest was 22° below zero at Maryville on the 23d.

PRECIPITATION

The average for the State, 213 stations reporting, was 2.24 inches, or 0.06 inch less than the 61-year January average. The greatest monthly amount was 5.73 inches near Annapolis, and the least was 0.25 inch at Joplin Airport. The greatest amount reported in 24 hours was 4.35 inches near Annapolis on December 31st-January 1st. The average number of days with 0.01 inch, or more, was 6.

Snowfall averaged 7.5 inches, or 3.1 inches more than the 57-year January average. The greatest monthly snowfall reported was 21.3 inches near Black.

MISCELLANEOUS PHENOMENA

Dust.—Locally, on 15th at Amity, Browning and Tarkio.

Floods.—In Black River, at Poplar Bluff, 2d to 6th. In Meramec River, 2d to 3d. In St. Francis River, at Fisk, 3d to 13th.

Fogs.—Heavy, 1st, 2d, 5th, 8th, 10th, 25th, 29th, 30th, 31st.

Glaze.—1st, 2d, 4th, 11th, 29th, 30th, 31st. (See special storm table).

Sleet.—1st, 3d, 4th, 11th, 12th, 20th, 21st, 22d, 26th, 29th, 30th, 31st, (See special storm table).

Windstorms.—1st. (See special storm table).

ERRATA

July 1947, page 55: Mean maximum temperature at Joplin Airport should be 89.5.
September 1947, page 66: Number of partly cloudy days at Warsaw should be 8.

Missouri Storms, January 1948

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Holt	Dec. 31–Jan. 1	During night	High wind	NW	....	....	0	None reported	Observer at Oregon reported this was "considered the hardest wind ever known here during winter. A dead calm settled at 2:30 a. m. for 40 minutes and a roaring noise, possibly a tornado, passed overhead."
Bates	1	During night	High wind	SW	....	....	0	Not reported	At Butler a very bad windstorm from the southwest, at 1:00 a. m., blew down telephone lines. The high wind was preceded by a bad sleet storm on December 31st. At Altona "a terrific windstorm of tornado velocity in many sections" was reported on January 1st, and was preceded by rain, sleet and snow New Years eve.
Lafayette	1	After 2:00 a.m.	High wind	NE	....	....	0	Minor	At Lexington, "some windows and trees were broken by wind from the northeast lasting about 15 minutes." The wind was preceded by two inches of sleet that later turned to snow.
Jackson	1	....	High wind	NE	....	....	0	Not reported	Scores of windows broken and buildings under construction damaged.
Over most of State	Dec. 31–Jan. 1	During the day and night	Glaze, sleet and snow	SW	Approximately 60	Across the State from SW to NE	15	$750,000 to $1,000,000	Freezing rain that began on December 31st, accompanied by sleet at many stations, occurred over most of the State, except the extreme southern portion and most of the Southeastern Division, changed to snow on January 1st, resulting in the worst storm of this nature in Missouri since the one of December 16-19th, 1924. Extensive damage was done to fruit and shade trees and power and communication lines and poles and the movement of all surface traffic and pedestrians was greatly hampered by the heavy coating of ice, sleet and snow. A strip about 60 miles wide across the central portion of the State, extending from Vernon and Bates Counties northeastward to Knox, Lewis and Ralls Counties was the hardest hit by the storm. Fourteen persons were killed in a Missouri Pacific train wreck near Otterville, Cooper County, on the morning of January 1st and another died of exposure at Warsaw, in which this storm was not the direct but was a contributing cause. Numerous accidents to pedestrians and motorists resulted in injury to many persons and damage to many automobiles because of the ice-covered highways, roads, streets and sidewalks. The Southwestern Bell Telephone Co. reported damage of $100,000 to their lines and poles, with 14,248 wire breaks, 300 poles down and 200 toll lines out of service in their eastern Missouri division alone. At Columbia the entire R. E. A. system was knocked out and 2,100 members were without electric and power service. Damage was estimated at $10,0000 to $12,000 to that agency. The Columbia Municipallight and power plant reported damage of $20,000 to $25,000 to its system, while the telephone company there reported damage of at least $10,000 to its equipment. At Fulton the damage to the city electric and water plant was estimated at $7,500 while the total damage in Fulton and in Callaway County was estimated at $500,000, or more. It was stated that it would take 30 to 50 years to replace the hundreds of fruit and shade trees that were damaged in Fulton by this storm. Excerpts from remarks by observers from other places in the State suffering damage from this storm were:— Auxvasse—Heavy damage to trees, telephone and electric wires. Canton—Ice ¼ inch thick on wires and trees; all long distance and 50% of local telephone wires out. 90% of R. E. A. power lines out. Edina—Wires and trees broken; considerable damage. Fayette—½ inch coating of ice broke trees, electric and telephone lines. Fulton—Worst storm since 1924; damage to trees cost Callaway County $500,000. Macon—Trees and wires broken down. Martinsburg—Some light and telephone wires down; electric current off 1½ hours; trees damaged. Mexico—Trees, power and telephone lines broken; telephone and power service off in approximately 90% of residences; estimated a month will be required to clean up the trees. Salisbury—Heavy damage to trees, power, light and telephone lines. Saverton—Power and communication lines down in this area. Shelbina—Light, power and communication lines out all over town; a number of trees ruined. Steffenville—Heavy damage to trees and wires. Vandalia—Power and telephone lines broken. Appleton City—Great damage in this vicinity; trees, telephone and light wires broken. Boonville—14 persons killed in train wreck; heavy damage to trees and power lines; highway 40 very dangerous. Butler—Telephone lines down; high wind. Crocker—Glaze on trees, wires and shrubs until the 3d. Eldon—Much damage to trees, telegraph and power lines; city in complete darkness by 9:00 p. m. Dec. 31st; power and lights off for 72 hours at greenhouse. Marshfield—Severe damage to trees and power lines at Dixon; streets and highway 66 at and near Marshfield very slippery. Nevada—Much damage to trees and communications; utilities still out on Jan. 2d.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

ST. LOUIS, MO.

VOL. LII FEBRUARY 1948 No. 2

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

Both the temperature and precipitation averaged practically normal this month, for the State as a whole, but the snowfall averaged more and sunshine less than normal. No field work, in preparation for early spring plantings, was accomplished during the month.

No unusual temperatures occurred this month, extremes ranging from a high of 79° to a low of 9° below zero. Generally speaking, the first half of the month averaged considerably colder than normal while the latter half averaged considerably warmer than normal. The 8th was the coldest day during the month with minimum temperatures dropping to near zero, or below, over most of the State. The 17th and 18th were the warmest days with afternoon temperatures in the 60's and 70's. Distribution of the average temperature, with departures from normal, by divisions was:—Northern, 29.0°, −1.2°; Southwestern, 34.5°, exactly normal; Southeastern, 36.4°, −0.5°; for the State, 33.3°, exactly normal. Minimum temperatures of 32°, or below, and zero, or below, occurred on an average of 22 days and 1 day, respectively, for the State as a whole.

Precipitation averaged practically normal in each of the three divisions, and for the State as a whole, viz.:—Northern, 1.63 inches, +0.07 inch; Southwestern, 2.17 inches, +0.19 inch; Southeastern, 2.69 inches, −0.03 inch; for the State, 2.16 inches, +0.07 inch. Although the average precipitation for the month was nearly normal, the frequency was higher than normal for February, with an average of 10 days with 0.01 inch or more, or 4 days more than normal. The distribution of the month's precipitation varied greatly, ranging from a total of 5.42 inches at Deering, in the extreme southern tip of the State, to only 0.36 inch at Bethany, in the extreme northern portion. Rain, snow, sleet, glaze and light local hail constituted the various forms of precipitation during the month. Sleet and glaze were particularly general over most of the State on the 12-13th, resulting in hazardous traveling conditions and numerous traffic accidents and injuries to pedestrians. Snowfall averaged considerably more than normal for February and the ground was covered during most of the first half of the month, particularly over the northern half of the State. Some of this snow cover occurred on December 31-January 1st. Water supplies were rather low in some southwestern areas of the State during the month.

A few local wind storms of a damaging nature occurred on the 27th. (See special storm table for details). High winds occurred on several other days during February, but without damage.

Minor flooding occurred locally in the Grand and Mississippi rivers the latter part of the month.

Much cloudy, damp, foggy weather prevailed during February, with the ground being frozen and snow-covered most of the first half of the month and too wet to work the latter half. Consequently no field work or oat sowing was accomplished, outdoor farm work being confined chiefly to seasonal chores. Wheat appeared to be in good condition at the close of the

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 9)

month, but remained dormant. Fruit buds also remained dormant throughout the month. Livestock were in good condition, as a rule, but were on dry feed throughout February as very little grazing or foraging was possible due to snow cover the first part of the month and wet, muddy fields the latter part. More moisture to replenish water supplies was needed in some of the drier areas of the southwestern quarter of the State at the close of the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 107 stations reporting, was 33.3°, or exactly the same as the 61-year February average. The highest monthly mean was 41.5° at Caruthersville, and the lowest was 25.6° at Unionville. The highest reported was 78° at Ozark Beach on the 18th, and the lowest was 9° below zero at Amity, Conception, Kidder, Maryville and Unionville on the 8th.

PRECIPITATION

The average for the State, 215 stations reporting, was 2.16 inches, or 0.07 inch more than the 61-year February average. The greatest monthly amount was 5.42 inches at Deering, and the least was 0.36 inch at Bethany. The greatest amount reported in 24 hours was 1.65 inches at Lucerne on the 27th. The average number of days with 0.01 inch, or more, was 10.

Snowfall averaged 6.3 inches, or 1.3 inches more than the 57-year February average. The greatest monthly snowfall reported was 12.0 inches at Bowling Green.

MISCELLANEOUS PHENOMENA

Floods.—In Grand River, at Chillicothe, on 28-29th. In Mississippi River, at Louisiana, 20th to 26th; in the reach from Hannibal to Louisiana on 29th and continued into March; at Cairo, Ill., and below, on 18th and continued into March.

Fogs.—Heavy, 1st, 2d, 3d, 4th, 5th, 6th, 7th, 11th, 13th, 16th, 17th, 19th, 24th, 25th, 26th, 27th, 28th.

Glaze.—2d, 3d, 4th, 5th, 6th, 7th, 11th, 12th, 13th, 14th.

Hail.—Light, on 27th at Elsberry, Fayette, Kirksville, Salisbury, Shelbina, Steffenville, Butler, Clinton, Kansas City University.

Sleet.—3d, 4th, 5th, 6th, 7th, 11th, 12th, 13th, 14th, 20th, 27th, 29th.

Windstorms.—27th. (See special storm table). High winds on several other days, but without damage.

ERRATA

October 1947, page 74: Mean temperature at Albany should be 63.5; mean temperature and departure at Campbell should be 66.5 and +6.4, respectively. Average temperature and departure for Southeastern Division should be 65.4 and +7.0, respectively.

November 1947, page 82: Mean temperature at Brookfield should be 38.0. Mean temperature and departure at Licking should be 41.6 and −3.7, respectively. Number of days with 0.01 inch or more of precipitation at Seymour should be 9.

December 1947, page 90: Mean temperature at Shelbina should be 34.6[a]. Page 91: Mean temperature at Webster Groves should be 38.3. Page 95: Mean minimum temperature at Joplin Airport should be 29.2.

Annual 1947, page 98: Mean temperature at Brookfield and Shelbina should be 53.2 and 53.5, respectively. Number of days with 0.01 inch or more of precipitation at Seymour should be 73. Page 102: Mean temperature for November at Brookfield should be 38.0; annual mean should be 53.2. Mean temperature for December at Shelbina should be 34.6[a]; annual mean should be 53.5. Page 103: Mean temperature and departure for November at Licking should be 41.6 and −3.7, respectively.

Missouri Storms, February 1948

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Pike	27	12:30 p.m. to 1:30 p.m.	High wind	SW	100 yards	Approximately 1	0	$1,000	Damage confined to southern portion of Bowling Green. No damage to crops; all to buildings.
City of St. Louis and St. Louis County	27	1:40 p.m.	High wind	SW	....	....	0	....	Damage mostly confined to destruction of a number of plate glass windows, damage or destruction of a number of chimneys, more than 300 street lights in St. Louis proper (value estimated at $1,500—those broken). Six trolley poles snapped off in St. Louis County, and street car service tied up for a time in parts of the county.
Cape Girardeau, St. Francis, and Shelby	27	Day and night	High wind	SW	....	....	0	Minor	Minor damage to plate glass windows and the fire wall of one building at Jackson. Slight damage at Farmington by wind. A few outbuildings, one barn, and several window panes and porch of one house damaged in vicinity of Shelbina.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

Vol. LII March 1948 No. 3

Price: 5 Cents a Copy; 25 Cents a Year

GENERAL SUMMARY

March was a rather cold, wet, windy month and unfavorable for seasonal plowing and planting operations. As a result this work was two to three weeks behind normal advancement for this time of year, at the close of the month.

This was the second consecutive month of its name with subnormal temperature average; however, the current month averaged more than 5° warmer than March a year ago, which was the 7th coldest March in the past 61 years. As a rule, the first 13 days of this month averaged colder than normal. This cold period was followed by a warm period of above-normal temperatures for the next 13 days. During the remainder of the month daily averages fluctuated sharply, first below then above normal. The 19th, 20th, 24th, and 25th were, generally, the warmest days during the month, with daytime readings in the 70's, or 80's; the 11th and 12th were the coldest days, with minimum temperatures registering zero, or below, except in most of the Southeastern Division. Over much of the State, the latter two-day period was one of the coldest, for so late in the month, ever experienced in March. The sub-normal temperature averages were general over the entire State, each of the three divisions having averages and deficiencies from normal as follows:—Northern, 38.6°, −2.9°; Southwestern, 42.8°, −2.7°; Southeastern, 46.0°, −0.8°; for the State, 42.5°, −1.5°. A few stations in the eastern portion had average temperatures for March in excess of normal. The average number of days with minimum temperatures 32°, or lower, and zero, or lower, were 15 and 2, respectively, for the State as a whole.

Precipitation occurred rather frequently, i. e., on an average of 12 days, during March, and the distribution was quite irregular, ranging from a total of 8.39 inches at New Madrid to 1.96 inches at Bethany. The Southeastern Division had the greatest average, 5.23 inches, or 1.20 inches more than normal. The averages and departures from normal for the Southwestern and Northern Divisions were 4.93 inches, +1.78 inches and 4.18 inches, +1.59 inches, respectively. The State average, 4.78 inches, was 1.52 inches more than normal, and the greatest March State average in the past 10 years, except for 1945, with an average of 7.44 inches. Both rain and snow combined to make up the bulk of the month's precipitation, the latter form occurring during the first half of the month; no measurable snowfall occurred during the latter half. Except at the more northern stations, the ground was not covered with snow for more than a few days during the entire month, principally on the 10th and a few days thereafter. Over most of the northern quarter of the State the ground was covered by variable snow depths until the 13th or 14th of the month. Heavy to excessive 24-hour amounts of precipitation, of between two and three inches, occurred in each of the three divisions of the State, the greatest amounts being 2.38 inches at Kahoka on the 18-19th, 2.75 inches at Chadwick on the 1st and 2.86 inches at Campbell on the 26th.

The month was quite windy, with damaging windstorms or tornadoes on the 19th, 25th, 26th and 30th. Hail occurred quite frequently during the month, but, as a rule, no material

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 17)

damage resulted, except locally on the 19th and 26th. Thunderstorms were also rather numerous during March. For details of damaging storms see special storm table printed elsewhere in this issue.

Minor to moderate overflows occurred from one to three times in stretches of the Grand, Meramec, Missouri and Mississippi Rivers during March, and continued into April in portions of the latter stream.

The cold, wet weather during March seriously interfered with the preparation of ground for seeding of early spring crops and, as a consequence, very little field work had been accomplished by the close of the month. A very few oats were sown in the southwestern portion and a few early gardens were planted, locally, where the ground became dry enough. Wheat and grasses started growth after the severe cold spell on the 11th and 12th and by the close of the month were making good progress. Wheat apparently came through the winter in very good condition and prospects for a good crop were very favorable at the end of March. Fruit buds were beginning to swell the latter half of the month and blooms appeared near the close, in southern portions of the State. However, it was thought the extremely low temperatues on the 11th and 12th killed, or severely damaged fruits, especially peaches, in the northern half of the State, and locally elsewhere. Very little grazing was possible, due to wet and muddy fields, and dry feeding of livestock had to be continued throughout most of the month. Warmer and drier weather was urgently need as March closed, to permit preparation of the fields for seeding of spring crops. —M. R. W.

TEMPERATURE

The monthly mean for the State, 106 stations reporting, was 42.5°, or 1.5° colder than the 61-year March average. The highest monthly mean was 52.1° at Caruthersville, and the lowest was 32.6° at Tarkio. The highest reported was 87° at Greenville on the 25th, and the lowest was 17° below zero at Tarkio on the 11th and at Louisiana on the 12th.

PRECIPITATION

The average for the State, 214 stations reporting, was 4.78 inches, or 1.52 inches more than the 61-year March average. The greatest monthly amount was 8.39 inches at New Madrid, and the least was 1.96 inches at Bethany. The greatest amount reported in 24 hours was 2.86 inches at Campbell on the 26th. The average number of days with 0.01 inch, or more, was 12.

Snowfall averaged 5.9 inches, or 2.8 inches more than the 58-year March average. The greatest monthly snowfall reported was 24.5 inches at Tarkio.

MISCELLANEOUS PHENOMENA

Aurora.—14th.

Floods.—In Grand River, at Brunswick, 1st to 2d, 19th to 27th, and on 30th; at Chillicothe, 16th to 18th and 19th to 22d. In Meramec River, at Pacific, on 24th; at Valley Park, 28th to 29th. In Mississippi River, in the reach from Keokuk, Iowa to Dam No. 25, continued from February to March 14th; in the reach from Keokuk, Iowa to Grafton, Ill., March 11th and continued into April; in the reach at Cairo, Ill., and below, continued from February to March 13th; in the reach from Chester, Ill. to Caruthersville, Mo., 23d and continued into April. In Missouri River, at St. Joseph, 20th to 21st; at Waverly, and below, 20th to 29th.

Fogs.—Heavy, 1st, 2d, 6th, 13th, 15th, 19th, 22d, 23d, 24th, 31st.

Frosts.—Light, 7th, 16th, 17th, 31st; heavy, 17th, 28th; killing, 12th, 13th, 17th, 22d, 27th, 28th.

Glaze.—1st, 2d, 3d, 5th, 6th, 10th, 27th.

Hail.—Light, 15th at Brunswick, Canton, Carrollton, Hannibal, LaBelle, Macon, Steffenville; 18th at Boonville; 19th near Browning, Lexington, Vanzant, Defiance, Augusta, Irondale, Farmington; 21st at Butler; 25th at Maryville, Kansas City Airport, near Seymour; 26th at Conception, Louisiana, near Anderson, Campbell, Cape Girardeau, Cook Station, Fremont Tower, High Lookout, Koshkonong, Moselle, Parma,

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [6] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Windshield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. (C) Airport. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for March 1948

(See precipitation data in daily precipitation table)

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs. ᵃ, ᵇ, ᶜ, etc., number of days missing, for example, ᵇ indicates two days missing. Italics data interpolated. § Partly interpolated. (C) Airport.

Missouri Storms, March 1948

County	Date	Time	Nature of storm	Storm moved from	Width of path (miles)	Length of path (miles)	Loss of life	Property damage (estimated)	Remarks
Pemiscot	19	4:30 a.m.	High wind	SW	½	....	0	$2,000	Storm at Caruthersville where several roofs were blown off; some sign boards destroyed and trees blown down. No crop damage.
Caldwell	19	5:00 a.m.	Tornado	SW	650 feet	2	0	$15,200	11 farm buildings damaged in Easterville community; one residence and the bell tower of Easterville Church also damaged. Some chickens killed. Most people still in bed when strom struck.
St. Charles	19	5:30 a.m.	Tornado	SW	¼	....	0	Not reported	At Defiance power and telephone lines blown down. Hickory trees(some 50 years old) upooted, and sign boards scattered by the winds. Many farm buildings destroyed. Some plate glass windows blown in. Damage to buildings restricted to frame structures. Losses estimated at 30%.
Shelby	19	a.m. (hour not known)	High wind	W	....	....	0	Minor	Storm ocurred in scattered areas of County. Damage reported in small areas 20 miles north and 15 miles west, and also 10 miles east of Shelbina. Damage mostly confined to farm buildings. Some damage to residence roofs.
St. Charles	19	5:45 a.m.	High wind	W	....	....	0	$5,000	Only minor damage, mostly to farm buildings near Augusta. No crop or livestock losses.
Washington	19	6:00 a.m.	Tornado	SW	¼	....	4	Heavy	Storm occurred in southern part of County. Twenty injured. Several homes destroyed. Hardest hit were Belgrade, Belleview and Concord Townships. Many chickens and several head of livestock killed. Electric and telephone lines suffered much damage.
Jefferson	19	6:00 a.m.	High wind	SW	....	....	0	$1,000	Damage reported in Crystal City, Festus and Herculaneum. Roofs and trees damaged principally. Gusty wind all day; estimated 80 miles per hour gusts about 10:30 a. m.
St, Francois	19	6:15 a.m.	Tornado	SW	¼	1	0	$200,000	Storm struck Settleton, (north part of Bonne Terre). 18 persons injured, 3 seriously. Path of greatest damage one mile long. 20 homes destroyed and 30 more damaged. Some parked automobiles smashed. Trees uprooted and telephone and telegraph poles broken. "Miracle no one was killed" (Mayor of Bonne Terre). More than 150 buildings including barns, garages, and outbuildings were damaged.
Franklin	19	6:50 a.m.	Tornado	SW	⅛	16	0	$250,000	From near Beaufort through Jeffriesburg to east of Union. Crop damage $5,300, livestock losses $7,000. Nearly everything in path damaged or destroyed. No doubt greatest catastrophe in Franklin County's history, according to Franklin County Tribune. Storm first struck 3 miles west of Sullivan, where damage was slight, turned north and wrecked home, barn and all outbuildings near Noser's Mill, then turned slightly east and damaged or destroyed a number of homes, barns and outbuildings, continuing northeastward; many other buildings destroyed. Utility lines taken down over quite an area. 18 persons injured.
St. Francois	19	8:00 a.m.	High wind	SW	½	....	0	$5,000	Severe damage to only small area at Farmington; minor damage such as uprooting or damage to some trees, most of damage to roofs and outbuildings. Some window panes broken. Electric and telephone wires downed by falling trees and limbs. One person injured near Farmington.
Jefferson	19	2:05 p.m.	Heavy hail	SW	1	1	0	$1,000	Storm occurred at Herculaneum. Most of damage to roofs. Stones ⅝ to one inch in diameter.
Carroll	25	9:30 p.m.	High wind	SW	About 1	....	0	$2,500	Occurred at Carrollton and vicinity. Little if any crop damage. Most damage neighboring farm areas and confined to barns and small buildings. Only minor damage in Carrollton. Trees, wires and poles damaged slightly.
St. Charles	26	1:45 p.m.	Small tornado	SW	300 feet	....	0	$65,000	Two persons slightly injured near St. Charles. Damage confined to Smartt Field, a deactivated Navy field. Only 4 persons at the Field and two were injured trying to get to a safe place from storm, one injured when ¾ ton pickup truck was tossed 75 feet against wrecked Administration Building—other suffered only slight finger cut. Storm moved into Illinois.
Warren	26	Between 1:00 and 2:00 p.m.	Moderate to heavy hail	SW	2	....	0	Considerable	Considerable damage to neon signs, awnings and some windows. No crop damage.
Taney	30	6:30 p.m.	Small tornado	SW	1¼	About 10	0	$16,300	Storm occurred at Ozark Beach. Two houses, 3 tourist cabins and 3 barns destroyed. Several other barns and outbuildings damaged. Minor damage to several other buildings. Crop losses estimated at $1,000; livestock (2 cows) $300.

NOTE.—Several of the Missouri tornadoes on the 19th went into Illinois where destruction was much greater and fatalities more numerous. Time used on this tabulation is Central Standard Time, unless otherwise indicated.

Vol. LII APRIL 1948 No. 4

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

For the State, as a whole, this month was the driest April in the 61 years State-wide records have been kept in Missouri. It was also the fourth-warmest month of its name for that period of time, for the whole State. This combination of warm, dry weather was very favorable for all outdoor work and for preparing the ground for seeding of early spring crops, and this work, two to three weeks behind normal advancement at the beginning of the month, progressed rapidly as the month advanced and by the close was further along than usual at that time of year.

The warm weather was general over the whole State, all three Divisions having monthly averages well above normal, viz:—Northern, 58.2°, +5.1°; Southwestern, 61.9°, +5.7°; Southeastern, 61.6°, +4.5°; for the State, 60.6°, +5.2°. Each individual station in the State also had a monthly temperature average in excess of normal, some stations as much as 6° or 7° above normal. The 1st, 2d, 3d, 9th, and 14th were the coldest days of the month, while the 6th, 7th, 16th, 17th, 18th, 23d, 24th, 26th, and 27th were the warmest. Near freezing temperatures, or below, were confined to the first few days and again on the 14th, as a rule, with an average of only 2 days during the month with minimum temperature 32°, or lower, for the State as a whole. At a number of stations, mostly in the southern half of the State, no freezing temperatures were recorded during April. There was practically no frost damage during the month, as vegetation was not advanced enough, as a rule, to be damaged the first half of April and no frost occurred during the latter half. Daytime temperatures did not go higher than the high 80's or low 90's anywhere in the State, the absolute maximum being 91° at two southeastern stations on the 27th.

Precipitation during April was all in the form of rain, no measurable snowfall being recorded anywhere in the State. Only three stations, all in the Northern Division, reported a Trace of snowfall during April. The month's rainfall was irregularly distributed, ranging from a total of 4.85 inches at Doniphan to only 0.39 inch at Marshall. Average precipitation, with departures from normal, for each of the three divisions and for the State were as follows:—Northern, 1.69 inches, —1.79 inches; Southwestern, 1.29 inches, —2.91 inches; Southeastern, 2.44 inches, —1.99 inches; for the State, 1.81 inches, —2.23 inches. Although the monthly averages for the State and for the Southwestern Division were the least in the past 61 years, drier Aprils have occurred in both the Northern and Southeastern Divisions, namely in 1924 and 1888 in the former division and in 1930, 1924, 1915, 1906, 1895, 1891, 1889 and 1888 in the latter division. Despite the decidedly deficient rainfall during April the Mississippi River, in the reach bordering the State, was near, or above, flood stage during the first few days of the month at most places above Cairo, Ill., and throughout the entire month below that point.

Damaging storms during the month were of a local nature and not unusually severe anywhere. Hail was rather frequent and general on several dates, but, as a rule, was mostly light to moderate and resulting damage was mostly neglible. For details of damaging storms see accompanying storm data table, elsewhere in this issue.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 25)

The warmer and drier weather, that was so urgently needed at the close of March, materialized early in April and prevailed, generally, throughout the remainder of the month. Field work and the planting of early spring crops that had been delayed as much as two to three weeks by wet, cold weather during March, progressed rapidly under the more favorable conditions during April and this work was further advanced than normal at the close of the month. Fall-sown small grains made good growth and were in excellent condition at the close of the month, but were needing rain. Oat seeding was mostly completed by the third week of April, but dry weather the latter half of the month delayed germination and growth. Most of the oat crop was sown considerably later than usual this year. Pastures and meadoes were slow in getting started and were short and in need of general soaking rain at the end of the month. First cuttings of alfalfa were being made the last few days of the month. About one-third of the corn crop was planted by the close of April, while most of the cotton crop had been planted, in the cotton growing counties of the State, by that time. Fruit trees bloomed heavily during the month and prospects were favorable for a good crop of all fruits, although not as large a crop as last year was expected. Some damage was done to peaches by the extremely low temperatures in mid-March. Early gardens and truck crops were planted early in the month and made good progress, but were needing a general soaking rain, as were all other crops and grasses, at the close of the month.—M. R. W.

TEMPERATURE

The monthly mean for the State, 104 stations reporting, was 60.6°, or 5.2° warmer than the 61-year April average. The highest monthly mean was 65.8° at Caruthersville, and the lowest was 54.2° at Memphis and Unionville. The highest reported was 91° at Doniphan and Poplar Bluff on the 27th, and the lowest was 22° at Maryville on the 1st.

PRECIPITATION

The average for the State, 212 stations reporting, was 1.81 inches, or 2.23 inches less than the 61-year April average. The greatest monthly amount was 4.85 inches at Doniphan No. 1, and the least was 0.39 inch at Marshall. The greatest amount reported in 24 hours was 2.46 inches at Deering on the 12-13th. The average number of days with 0.01 inch, or more, was 6.

There was no snowfall, except a trace at a few scattered stations in the Northern Division.

MISCELLANEOUS PHENOMENA

Floods.—In Mississippi River, in the reach from Keokuk, Iowa to Cairo, Ill., continued from March to various dates the first half of April; in the reach below Cairo, continued from March, throughout April and into May. In St. Francis River, at Fisk, April 1st to 7th and 15th to 17th.

Fogs.—Heavy, 4th, 6th, 10th, 13th, 14th, 15th, 26th, 27th.

Frosts.—Light, 1st, 2d, 3d, 9th, 10th, 13th, 14th, 15th; heavy, 2d, 9th, 14th; killing, 1st, 2d, 3d, 9th, 14th.

Hail.—Light, 1st at Lexington; 4th near Maryville; 5th New Florence, Centerville No. 2, Cuba, Moselle, Roby, St. Louis, near Sullivan; 6th Amity, near Browning, Brunswick, Carrollton, Hannibal, Kirksville, Linneus, Saverton, Trenton, Lexington, Marshall, St. Louis Airport; 7th Albany, Bethany, Saverton, Crocker, Jackson, St. Louis, St. Louis University, Sikeston; 9th Neosho; 10th Springfield, High Lookout, Roby; 11th Unionville; 12th Columbia, Kansas City Airport, Martinsburg, New Florence, Kansas City University, Lexington, Springfield, Warrensburg, Macedonia Lookout, Moselle, St. Louis, St. Louis Airport, St. Louis University, Webster Groves; 17th Oregon; 21st Sprinfield; 22d near Browning, Shelbina; 26th Bethany, Brunswick, Kirksville, Lathrop, Macon, Oregon, Polo, St. Joseph Airport; 30th Marshfield. Moderate, 4th Tarkio; 5th Edgerton, Martinsburg, Warrenton, Wellsville, near Montgomery City, near Mexico; 6th Chillicothe Airport, Kirksville Airport, Moberly, Higbee, Oregon; 7th Cape Girardeau; 26th Amity, Edgerton. Heavy, 6th LaBelle, Lewistown with slight damage, Jefferson City; 9th Granby and scattered areas of Newton County. (See special storm table).

Sleet.—12th.

Tornado.—6th. (See special storm table).

Windstorm.—6th. (See special storm table).

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

Missouri Storms, April 1948

Place	Date	Time	Width of path	Loss of life	Value of property destroyed	Character of storm	Remarks
Boone County	6	10:00 p.m. to 10:05 p.m.	....	0	$800	High wind	Principal damage to a farm 20 miles north of Columbia, and about 2 miles off Highway No. 63. A garage and the automobile therein damaged; several small outbuildings damaged.
Randolph County	6	9:20 p.m.	1000 feet	0	$50,000	Tornado	Storm at Higbee, over an area about 3 city blocks square, in center of the town, with greatest damage over 2 blocks. About 200 structures (houses and store buildings) damaged but none completely destoyed. Many window panes blown out and some large plate glass ones broken. One person slightly injured by flying glass. Trees and wires blown down and broken.
Grundy County	6	At night	....	0	....	High wind	Damage estimated at "several thousand dollars". Many roofs damaged, chimneys blown over; many window panes and some large plate glass windows were blown out and broken. Utility wires were also broken and trees damaged. Storm occurred at Trenton.
Newton County	9	11:30 p.m.	½ mile	0	....	Heavy hail	At Granby there were some hailstones as large as small hen eggs. Fall of hail was heavy. Considerable damage to roofs, strawberry beds and spring gardens at Granby and also over other scattered areas in Newton County.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. LII MAY 1948 No. 5

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

May averaged slightly cooler and considerably drier than normal, but it was a favorable month for outdoor and field work and for good crop growth and development, particularly the latter half.

No unusual extremes of temperature occurred during the month and no outstanding warm or cool periods prevailed. Low nighttime temperatures were mainly responsible for the average temperature deficiency for the month; daytime temperatures averaged slightly higher than normal, as a rule. Monthly average temperatures by divisions, with departures from normal were:—Northern, 62.6°, —0.7°; Southwestern, 64.4°, —0.5°; Southeastern, 64.7°, —1.1°; for the State, 63.9°, —0.5°. This was the fourth consecutive May with below-normal temperature average for the State, as a whole. It was the warmest May, however, since 1944 and averaged 1.6° warmer than May a year ago. Light frost formed locally on the 7th and 8th, but without causing any damage. No freezing temperatures were recorded anywhere in the State.

Precipitation, although deficient, was generally sufficient for current needs, during most of the month. The greater part of the month's rainfall occurred during the first half, the latter half being almost rainless, except for more or less local showers on the 22-23d and scattered unimportant light showers on the 30th. Monthly totals varied from 6.85 inches at Farmington to 1.25 inches at Moberly. The three divisions of the State had averages and deficiencies from normal as follows:—Northern, 2.97 inches, −1.66 inches; Southwestern, 3.85 inches, −1.36 inches; Southeastern, 3.69 inches, —0.86 inch; for the State, 3.50 inches, −1.30 inches. This was the driest May since 1941, for the State as a whole, and also for each of the three divisions. It was the second consecutive month of the current season averaging drier than normal, the deficiency for the two months being 3.53 inches, for the State. Heavy to excessive rains occurred locally on the 1st-2d and again on the 15th, when 24-hour amounts of more than two inches to as much as 3.75 inches were recorded at some stations. There was no snowfall recorded anywhere in the State.

Damaging storms were mostly local and confined to the 1st, 10th, and 15th and were not particularly severe. Thunderstorms were rather frequent during the first half of the month, but generally without damage, except on dates mentioned. On the afternoon of the 10th, at St. Louis, a man was struck and killed by lightning and five other persons were slightly shocked.

No floods occurred during the month in any of the major rivers of the State, except in portions of the Mississippi and the St. Francis rivers. As a rule, river stages steadily decreased during the month and were much lower at the close than at the beginning of May.

General soaking rains, that were needed at the close of April, set in the first day or two of May and beneficial showers were frequent until the middle of the month, after which there was very little rainfall, except local showers on 22-23d. The moisture received during the first half of the month was generally sufficient to sustain growing crops and grasses throughout the remainder of the month, although by the end of May more rainfall was beginning to be needed in most areas of the State.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. [a], [b], [c], etc., number of days missing; for example, [b], indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 33)

Small grains made very good progress during the month and prospects for a larger than average crop, particularly wheat, were excellent. Wheat was heading and in the southern portion of the State was beginning to ripen by the close of the month. Oats also were beginning to head, particularly over the southern part of the State, at the end of May and although the crop was planted late it made very good growth during the month and was in good condition at the close. Pastures and meadows were rather slow in getting started during April and the first half of May, but improved rapidly the latter half and were in good condition at the end of the month, but needing rain. First cuttings of alfalfa and clover hay were made during May, but this work was hampered by showers the first half of the month, while the latter half was very favorable for hay harvest. Corn planting was mostly completed during the month, over much of the State, and the crop came up to a good stand, but some replanting was necessary because of cut worms and soil erosion. Cultivation of the early planted corn corp was in progress the latter part of the month. Nearly one-half of the soybean crop had been planted by the end of May, for the State as a whole, while in some sections nearly two-thirds of that crop had been planted. Cotton planting was completed early in the month in the southeastern counties of the State and chopping and cultivation was in progress at the close; the crop made good progress throughout the month. Fruits were not too promising and, as a rule, were not expected to produce as large a crop as last year. Strawberries ripened and were mostly marketed by the end of the month. In the commercial growing areas, in the southern half of the State, the crop was fairly good, but in the northern half it was generally poor. General soaking rains were needed for best growth and development of most crops, grasses, and gardens at the close of May. —M. R. W.

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 63.9°, or 0.5° cooler than the 61-year May average. The highest monthly mean was 69.6° at Caruthersville, and the lowest was 60.4° at Unionville. The highest reported was 92° at Canton on the 20th and at Ozark Beach, Cape Girardeau, and Jackson on the 21st, and the lowest was 33° near Black on the 6th and near Anderson on the 7th.

PRECIPITATION

The average for the State, 207 stations reporting, was 3.50 inches, or 1.30 inches less than the 61-year May average. The greatest monthly amount was 6.85 inches at Farmington and the least was 1.25 inches at Moberly. The greatest amount reported in 24 hours was 3.75 inches at Farmington and Weingarten on the 15th. The average number of days with 0.01 inch, or more, was 10.

There was no snowfall reported anywhere in the State.

MISCELLANEOUS PHENOMENA

Auroras.—2d, 15th.

Floods.—In Mississippi River, at Cairo, Ill., and below, continued from March to May 3d. In St. Francis River, at Fisk,

Fogs.—Heavy, 3d, 4th, 5th, 11th, 12th, 13th, 15th, 16th, 24th.

Frosts.—Light, 7th, 8th.

19th to 20th.

Hail.—Light, 1st at New Florence, Bolivar, Butler, Harrisonville, Jefferson City, Lockwood, Marshfield, Pierce City, Sedalia, Springfield, High Lookout, St. Louis; 2d at Martinsburg, Fremont Lookout, High Lookout, Jackson, Parma, Sikeston, Webster Groves, Lakeside; 3d at Springfield; 5th at Anderson; 9th at St. Joseph; 10th at Butler and High Lookout; 15th at Amity, Shelbina, Warrenton, Anderson, Granby, Monett, Pierce City, Roby; 23d near Sullivan. Moderate, 1st at Columbia, Warrenton, Altona, Eldon, Joplin Airport, St. Louis Airport, Fulton; 2d at Caruthersville; 3d at Lockwood and Koshkonong; 10th at Shelbina and Sweet Springs. Heavy, 1st at St. Thomas, Woolridge, and southern third of Cooper county; 3d at Butler; 15th, 6 miles east and 12 miles south of Amity, and at Wilderness Lookout. (See storm table for details and damage).

Tornadoes.—1st, 10th. (See storm table).
Windstorms.—1st, 2d, 10th. (See storm table).

OBITUARIES

Mr. Tilton Davis, River Observer at Lexington, Mo., died May 10, 1948 at the age of seventy years. Mr. Davis served as both River and Cooperative Observer from April 1, 1945 to October 16, 1947, when he resigned from the latter position but continued as River Observer until his death. Mr. Davis was a veteran pilot of ferry boats crossing the Missouri River at Lexington and at one time was owner of extensive tracts of river bottom lands in that area. With his passing the Weather Bureau and the people of Lexington have been deprived of the services of a veteran river man and public-spirited native citizen.

Mr. A. W. Madison, Cooperative Observer at the Hailey, Mo. station for the past 23 years, died May 10, 1948. Mr. Madison's services began on May 1st, 1925 and he served continuously and faithfully until his death. With his passing the Hailey community and the Weather Bureau have lost a respected citizen and a loyal co-worker.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs. ^{a}, ^{b}, ^{c}, etc., number of days missing, for example, ^{b} indicates two days missing. Italics data interpolated. § Partly interpolated. (C) Airport.

Missouri Storms, May 1948

Place	Date	Time	Width of path	Loss of life	Value of property destroyed	Character of storm	Remarks
Boone County	1	7:20 p.m.	....	0	$2,500	High wind	Many power and telephone lines broken. Many limbs, few trees damaged and a few chimneys blown over. Storm in Columbia and vicinity, and was accompanied by moderate hail with slight damage to gardens and crops. Hailstones up to ¾ inch were reported.
Miller County	1	9:10 p.m.	12 miles	3	$25,000	High wind	At Eldon and surrounding territory many sign boards, some buildings damaged. Slight damage to crops and gardens. Power and communication lines damaged. Three young men drowned when boat capsized during the storm, about 3 miles above Bagnell Dam. Storm was accompanied by light to moderate hail with stones up to ½ inch in diameter. Path 12 miles wide and 15 miles long.
Cole County	1	9:35 p.m.	¼ mile	0	$500,000	Tornado	Some livestock and poultry killed and crippled. Several homes completely unroofed, and nearly all homes, in town of 200 people, damaged. Several houses twisted on their foundations. Only slight crop damage. 2 persons injured. Storm in and around St. Thomas. Heavy hail preceded the tornado by an hour or two; stones ranged up to size of a walnut. Storm path ¼ mile wide and ½ mile long. Storm moved from west.
Cooper County	1	Between 10:00 p.m. and 11:00 p.m.	3 miles	0	Considerable	Heavy hail	Storm near Wooldridge. Pastures, gardens, fruit trees, oats and wheat crops badly damaged. Many roofs damaged. Some wildlife killed. Some stones 3 inches in diameter. Southern third of county also hit by this storm. Path 3 miles miles wide and 20 miles long.
Callaway County	1	10:00 p.m.	....	0	$5,000	High wind	In and around Fulton, where several barns and other outbuildings were damaged or demolished. Some poultry killed. Hail accompanied the storm with some damage to gardens.
Franklin County	1	10:45 p.m.	375 feet	0	....	High wind	Many trees destroyed in Missouri Botanical Gardens, Gray Summit. 50 of the oldest and largest trees, some 120 to 150 years old, 100 feet high and 3½ feet in diameter uprooted or split. Width of path 375 feet and 1¼ miles long.
St. Louis County and City of St. Louis	1	11:28 p.m. to 11:40 p.m.	....	0	$300,000	High wind	This storm also struck East St. Louis–Granite City–Monsanto, Illinois. Damage in City of St. Louis estimated at $100,000. Winds estimated at 75 miles per hour. Many houses and some apartment buildings unroofed in St. Louis, and at least 9 persons slightly injured, mostly by flying glass. Power and telephone wires taken down, many trees broken and some uprooted. Some automobiles damaged by falling trees and other objects. Wind from the northwest.
Webster County	10	2:00 a.m.	1 block	0	$5,000	Tornado	This storm was probably a small tornado and hit southern part of the town of Marshfield, where several houses were damaged, some trees uprooted and some telephone and power lines taken down. Path one block wide, length not known. Storm moved from southwest to northeast.
Pulaski County	10	2:30 a.m.	100 yards	0	$1,000	High wind	Some trees blown down, several barns, machine sheds, and outbuildings damaged; some damage to a few roofs, chimneys and plate glass windows, at and near Crocker. Wires were broken disrupting electric service. Width of path 100 yards. Wind from the west.
Saline County	10	....	1 mile	0	....	Moderate hail	Early gardens damaged considerably in Sweet Springs and surrounding areas. Some stones 1 inch in diameter. Storm path was 1 mile in width and 2½ miles in length.
Laclede and Texas Counties	10	11:45 a.m.	50 yards	0	$1,000	High wind	Several barns and other outbuildings damaged. Some trees uprooted. Most damage between Lynchburg and Eveningshade. Some damage to timber. (Lynchburg is in Laclede County; Eveningshade in Texas County). Storm path averaged only about 50 yards wide; length approximately 10 miles.
Stone County	15	....	1 mile	0	$1,000	Moderate to heavy hail	Most damage to strawberries and gardens, in a storm at Lampe and vicinity. Stones up to 1 inch in diameter. Path of storm 1 mile wide, 10 miles long.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. LII JUNE 1948 No. 6

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

June averaged slightly cooler and considerably wetter than normal, despite the fact that the first half of the month was extremely dry. On the whole, it was a very favorable month for all growing crops and the outlook at the close of the month was very promising for a bumper crop of corn and wheat.

Temperatures averaged practically normal over each of the three divisions and for the State as a whole, as follows: Northern, 72.0°, —0.4°; Southwestern, 73.6°, +0.1°; Southeastern, 74.2°, 0.0°; for the State, 73.3°, —0.3°. There were no unusual extremes of temperature recorded anywhere in the State, the range being from a maximum of 100° to a minimum of 42°. No unusual or prolonged periods of either warm or cool weather prevailed during the month, day-to-day averages showing little variation, as a rule. The rather high humidity that prevailed during the wet period the latter half of June made the relatively mild temperatures feel oppressive and uncomfortable. The 4th, 5th, 10th and 11th were the warmest days during the month and the 1st, 2d, 3d, and 9th were the coolest days, generally.

Precipitation during the latter half of May and the first half of June was extremely light over the whole State and droughty conditions were fast becoming serious, until general and copious rains set in on June 14-15th, after which rain occurred almost daily throughout the remainder of the month, causing June to average considerably wetter than normal, for the State as a whole. Precipitation averages, with departures from normal, by divisions, were: Northern, 5.24 inches, +0.32 inch; Southwestern, 10.46 inches, +5.28 inches; Southeastern, 6.58 inches, +2.23 inches; for the State, 7.43 inches, +2.61 inches. This was the second consecutive June with above-normal precipitation and the sixth wettest month of that name in the past 61 years, for the State as a whole. Over the Southwestern Division the current month was the third wettest June for the same period of time. This month's precipitation was very irregularly distributed, monthly totals ranging from 17.29 inches at Concordia to only 1.60 inches at Canton. Heavy to excessive 24-hour amounts of over four to more than five inches occurred locally on the 17-18th and 20th-21st, with one unofficial report of nine inches in approximately eight hours time over an area of about eight square miles, 12 miles southeast of Marshall, on the 14th. Serious soil erosion occurred during these periods of excessive precipitation.

There was some minor flooding in the Missouri, Gasconade, Grand, and Osage rivers during the month with resultant damage to crops on low ground along those streams. As a rule, river stages at the close of June were relatively high for that time of year and were much higher than at the beginning of the month, due to the almost daily rainfall the latter half of June.

Severe storms, particularly electrical storms, were unusually numerous during June, mainly during the last two weeks of the month, resulting in considerable loss of property and crops but fortunately no loss of human life. For details see special storm table printed elsewhere in this issue.

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ^{a}, ^{b}, ^{c}, etc., number of days missing; for example, ^{b}, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. [4] Best available used for stations not equipped with recorders. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 41)

The dry, warm weather prevailing at the close of May continued until mid-June and most crops were suffering and deteriorating from lack of moisture by that time. However, timely and general rains set in on the 14-15th relieving this prolonged droughty condition, which had become progressively meanacing, and throughout the remainder of the month the moisture situation was more than ample for all requirements and fields were too wet to work, as a rule. The first two weeks were ideal for cutting and curing of first cuttings of alfalfa and red clover hay and for cultivating and planting corn and other row crops. Corn planting was practically completed during the month and the crop made rapid progress during the latter half, although fields were becoming weedy and grassy by the close due to wet fields preventing cultivation. The crop was in various stages of development, ranging from tasseling to just coming up, at the end of June. Considerable replanting was necessary due to cut-worms and poor germination, occosioned by the dry weather the first half of the month. Wheat continued to make good progress despite the dry weather, which helped to hasten maturity of the crop. By the end of June harvest by binders had begun in some areas, particularly the southeast portion, and yields per acre were expected to be record-breaking. Frequent rains and wet fields were hampering the work of cutting the wheat crop and much of it was being left for combining later. Oats suffered from the dry weather the first half of the month, and being sown later than unual, were heading rather short. However, the rains the last half of the month greatly improved that crop and a normal yield was indicated. The bulk of the soybean crop had been planted during the month and it was making rank growth and was in very good condition at the close. Cotton also made good growth and development during June and squares were appearing in most fields, at the close, although cultivation of the crop was hampered the latter half by frequent rains and wet fields. Pastures and hay crops responded rapidly to the ample moisture during the latter half of the month and second cuttings of alfalfa were ready but were being delayed by wet weather. Gardens and truck crops were greatly improved by the rains during the last half of June and were in good condition at the end of the month. Fruit prospects were only fair with about one-half a normal crop of peaches and apples expected. A period of a week or ten days of dry weather was badly needed as the month closed to cultivate fields and harvest the wheat, oats and hay crops.—M. R. W.

TEMPERATURE

The monthly mean for the State, 106 stations reporting, was 73.3°, or 0.3° cooler than the 61-year June average. The highest monthly mean was 78.0° at Caruthersville, and the lowest was 69.2° at Unionville. The highest reported was 100° at Brookfield on the 11th, and the lowest was 42° at Marble Hill and Elsberry on the 1st, Arcadia on the 2d, Edgerton on the 9th, and Fulton on the 10th.

PRECIPITATION

The monthly mean for the State, 210 stations reporting, was 7.43 inches, or 2.61 inches more than the 61-year June average. The greatest monthly amount was 17.29 inches at Concordia, and the least was 1.60 inches at Canton. The greatest amount reported in 24 hours was 5.79 inches at Sedalia on the 17-18th. The average number of days with 0.01 inch, or more, was 12.

MISCELLANEOUS PHENOMENA

Floods.—In Gasconade River, at Jerome, on 19th. In Grand River, at Chillicothe and below, 24th to 26th. In Missouri River, at Hermann and below, 23d and continued into July; in the reach from Waverly to Boonville, 24th to 25th; at Jefferson City, 25th to 26th; at Waverly, on 30th and continued into July. In Osage River, at Osceola and below, 22d and continued into July.

Fogs.—Heavy, 6th, 15th, 16th, 17th, 29th.

Hail.—Light, 5th at Camdenton, Springfield, Wasola, Webster Groves; 14th at Brunswick, Louisiana, Saverton, Marshall Airport, Warrensburg, near Sullivan; 15th at Eldon; 17th at Bolivar, Warrensburg, Vichy, in Pettis County; 18th at Oregon, Marshfield; 19th at Vanzant; 20th at Altona and Ashland; 22d near Sullivan; 26th at Birch Tree. Moderate, 5th at St. Louis University and scattered areas of St. Louis County

Except as otherwise indicated, amounts are for 24 hours ending late in afternoon. [1] Midnight to midnight. [2] Measured in the morning; for the preceding 24 hours. [3] Data for 24 hours ending 12:30 A. M. (C. S. T.) of following day. [5] Recording gage. T. Trace or 0.005 inch or less. * Included in next measurement. // Wind-shield on gage. Italics data interpolated. § Partly interpolated. (A) Record from cooperative station gage. (B) Record from river station gage. (C) Airport. ‡ Received too late to be included in means and extremes.

Daily Evaporation (inches), Mean Temperature (F°), and Wind Movement (miles) for June 1948

(See precipitation data in daily precipitation table)

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

(Continued from page 43)

and St. Louis City; 14th at Chillicothe Airport, Marshall Airport, Sweet Springs; 17th at Sedaila; 20th at Carl Junction and vicinity. Heavy, 14th at Elsberry, Hannibal, Stover, and in Cooper, Carroll, and Saline counties; 21st at Pierce City. (See special storm table).

Tornadoes.—20th, 27th. (See special storm table).

Windstorms.—5th, 14th, 15th, 17th, 18th, 19th, 20th, 21st, 22d, 26th, 27th. (See special storm table).

ERRATA

April 1948, page 26: Mean temperature and departure at Lexington and Sedalia should be 59.8, +5.2 and 61.5, +6.2, respectively. Maximum temperature and date at Shelbina should be 86 on 18th. Page 27: Maximum temperature and date at St. Louis University should be 89 on 7th. Page 31: Mean minimum temperature at Sedalia should be 49.3.

May 1948, page 35: Under heading Miscellaneous Phenomena, line 7 should follow line 3.

Missouri Storms, June 1948

Place	Date	Time	Width of path	Loss of life	Value of property destroyed	Character of storm	Remarks
St. Louis City and St. Louis County	5	6:40 p.m.	....	0	....	Wind and electrical	A few plate glass windows shattered, a few buildings and roofs damaged, some trees blown down and some utility wires down. Three persons slightly injured, two by falling carnival tent poles and one by lightning. Some hail in a few places, but no material damage. Aggregate damage rather small.
Dent County	14	4:00 a.m.	....	0	....	Wind	Storm in Salem and aggregate damage slight. Some tree limbs broken off, electric and telephone wires taken down. No crop loss to speak of.
Marion County	14	1:00 p.m.	2 miles	0	....	Wind and heavy hail	Hannibal and vicinity was site of this storm. Many trees blown over, fabric automobile tops damaged and some roofs also damaged. Gardens beaten down by hail. Largest hailstones over an inch in diameter.
Lincoln County	14	3:30 p.m.	1 mile	0	....	Heavy hail	Storm in vicinity of Elsberry. Roofs damaged, many windows broken, some greenhouse sashes destroyed. Gardens and crops also injured. Stones up to one inch in diameter.
Carroll County	14	Between 3:00 p.m. and 5:00 p.m.	1 mile	0	$30,000	Hail, high wind and electrical	Storm area from Bogard through Standish to east of Wakenda. Hay barn and contents destroyed when struck by lightning. Some poultry killed by hail. Many windows panes broken and some roofs and automobiles damaged by hail. One person injured when struck by large hail, some of which were reported to be the size of hen eggs. Much damage to standing crops. Crop damage estimated at $30,000. No estimate of property damage.
Saline County	14	4:45 p.m.	½ to 2 miles	0	$321,000	Wind and heavy hail	Storm damage in scattered parts of the county extending from northwest to southeast. Roofs damaged, many window panes destroyed, standing crops, including gardens damaged. Damage to crops estimated at about $300,000, to livestock and poultry $1,000 and to buildings, automobiles and other property about $20,000. Most of damage was in rural areas. Hailstones ranged up to 1½ to 2 inches in diameter. Bulk of damage from hail.
Cooper County	14	5:20 p.m.	10 miles	0	$11,000	Heavy hail	Storm at Blackwater and vicinity, where gardens, wheat and oats were damaged and corn stripped. Some roofs badly damaged, many windows broken. Hailstones up to 1¼ inches in diameter. Crop damage $9,000; property damage $2,000.
Cooper County	14	5:45 p.m.	8 miles	0	$100,100	Wind and heavy hail	Storm at Pilot Grove and vicinity. Hardly a home escaped without at least one window pane broken. Many roofs damaged. One person slightly injured by hail, striking his head. Some poultry killed and some crop damage. Damage mostly from hail. Largest stones size of hen eggs.
Cooper County	14	5:50 p.m.	8 miles	0	....	Wind and heavy hail	Storm at Bunceton and vicinity. Wheat and oats flattened and some corn damaged. Many roofs damaged by hail, many birds and some chickens killed. One barn blown down. Largest hailstones 1¼ inches in diameter. Estimate of damage not reported.
Morgan County	14	7:00 p.m.	1 mile	0	....	Heavy hail	Storm occurred at Stover and vicinity. Damage confined mostly to roofs. No crop damage. Stones ranged from small to size of hen eggs.
Pettis County	17	6:00 p.m.	....	0	$4,000	Moderate hail and high wind	Damage at Sedalia and in scattered areas of county. Some glass in greenhouses broken. Crop domage $3,000; property damage $1,000.
Pemiscot County	17-18	5 to 7 p.m. and 2 to 5 a.m.	¼ to 2 miles	0	....	Wind	Many poles and utility wires down. Damage, on the whole, slight. Occurred at Caruthersville and vicinity.
Webster County	19	9:00 p.m.	....	0	....	High wind	Trees blown down and broken and 3 power line poles broken off. Numerous power and telephone lines down. Storm occurred at Marshfield and vicinity. Some corn and small grain was blown down but no loss occurred.
Jasper County	20	6:25 p.m.	1 mile	0	$75,000	Wind and hail	Several roofs blown off and trees and wires broken in Carl Junction and vicinity where this storm occurred. Crop damage estimated at about $5,000 of the total shown. Storm was accompanied by some hail. Most of damage was from wind. Storm originated in Kansas.
Boone County	20	8:00 p.m.	130 yards	0	$5,000	Small tornado	Three homes and outbuildings damaged near Ashland; one man slightly injured. Crop damage slight. Some damage to trees and and wires.
Lawrence County	21	7:30 p.m.	1½ miles	0	$10,000	Wind and heavy hail	Many large shade trees destroyed, some homes damaged; several by falling trees. Some utility wires down. Storm struck Pierce City and vicinity. Slight crop damage. Hail was small.
Lawrence County	21	8:23 p.m.	300 yards	0	$3,000	High wind	Storm occurred at Verona and vicinity. Many trees uprooted or broken off, some falling on houses, barns and an automobile. Several outbuildings were demolished and some barns unroofed. Reported as a tornado but evidence does not bear this out. Some wheat and oat fields were flattened but no crop loss. Telephone service was disrupted.
Clinton County	22	7:30 p.m.	....	0	....	Wind	Several trees uprooted and wires blown down and a number of buildings damaged. Aggregate damage small. Storm occurred at Cameron.
Linn County	22	8:00 p.m.	½ mile	0	$6,950	Wind	Storm in and near Purdin. 40 or 50 trees uprooted, several porches torn off. A few buildings moved on foundations. Crop damage estimated at $1,950 of amount shown.
Livingston County	22	9:30 p.m.	70 yards	0	$14,000	Wind	Storm at Chillicothe Municipal Airport, 3 miles east of Chillicothe. Hangar damaged. Several planes also damaged and a number of trees uprooted. No crop damage.
Carroll County	22	10:15 p.m.	20 yards	0	$3,100	High wind	Storm struck two farms one mile northwest of Wakenda. A new machine shed was damaged at one farm and a tree fell on the house of another. Wheat was damaged to some extent but damage not reported.
Putnam County	27	12:00 noon	100 yards	0	$2,000	Wind	Storm at Hartford, where one large barn, 40 by 100 feet destroyed. No trees taken down.
Phelps County	27-28	Night	....	0	$25,000	Electrical	The U. S. Bureau of Mines Building at Rolla struck by lightning. Top floors gutted by fire that broke out.

Time used on this tabulation is Central Standard Time, unless otherwise indicated.

VOL. LII JULY 1948 No. 7

PRICE: 5 CENTS A COPY; 25 CENTS A YEAR

GENERAL SUMMARY

This was a rather wet month, for July, over much of the State, and it averaged slightly cooler than normal. It was a favorable month for all growing crops, but was too wet, generally, for harvesting of small grains and hay harvest.

Although no unusually high temperatures occurred, the prevailing high humidity made the month very trying on man and beast and a number of heat prostrations were reported during the month, particularly in the larger metropolitan areas. 100° temperatures occurred on only one day and at only one station; however, temperatures of 90° or higher occurred on an average of 13 days during the month, for the State as a whole. There were no prolonged periods of either unusually warm or unusually cool weather during the month, with only minor day to day changes in daily averages. The averages by divisions, with departures from normal, were as follows:—Northern, 76.9°, exactly normal; Southwestern, 77.5°, —0.4°; Southeastern, 77.9°, —0.2°; for the State, 77.4°, —0.6°.

Precipitation during July occurred on an average of 11 days, for the State as a whole, and the distribution was very irregular, ranging from a monthly total of 14.75 inches at Owensville to only 0.84 inch at Van Buren. The average for each of three divisions, with departures from normal were:—Northern, 5.33 inches, +1.72 inches; Southwestern, 6.48 inches, +2.88 inches; Southeastern, 4.55 inches, +1.16 inches; for the State, 5.45 inches, +1.92 inches. This was the wettest July since 1924 and the tenth wettest month of its name in the past 61 years. As compared with July a year ago, 3.28 inches more rain fell over the State during this month than during last July. Several stations received more than 10 inches of rainfall during this month while a number of others received less than two inches, except in the Southwestern Division where the least monthly total at any station was 2.31 inches. Very heavy to excessive local downpours occurred locally on the 5th, 13th, 22d and 25th, when amounts between 4 and 5 inches occurred within a period of 24 hours, or less. These heavy concentrations of rainfall, over rather small areas, caused serious erosion of the soil and flooded small streams, creeks and drainage ditches in those areas as well as streets and many basements in the St. Louis area on the 5th and 25th, resulting in considerable damage to property and minor damage to crops and gardens.

Damaging storms occurred locally on the 19th, 22d, 25th, 26th, and 27th, but were not particularly severe anywhere, except in Linn County. Thunderstorms were unusually numerous during the month at many stations, but as a rule, only minor damage resulted. For details of damaging storms see special storm table printed elsewhere in this issue.

Minor to moderate floods occurred in portions of the Grand, Missouri, Meramec, and Osage rivers during July, resulting in considerable crop damage on lowlands adjacent to those rivers.

Rains that occurred almost daily during the latter half of June, continued quite generally through the month of July, but with diminishing frequency. As a result of these generous amounts of moisture over most of the State, all growing crops

The departures from normal temperature are computed from the averages of the entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 years or more of record are computed from a normal or "standard mean", adjusted to a uniform 35-year period: for stations of 10 to 14 years the means for the period of record are used. The normal may be found by adding the departures when minus (−) or subtracting when plus (+). Figures and letters following stations indicate distance in miles and direction of station from the city Post Office, unless otherwise indicated. T. Trace or 0.005 inch or less. ᵃ, ᵇ, ᶜ, etc., number of days missing: for example, ᵇ, indicates two days missing. Italics data interpolated. § Partly interpolated. † And other dates. ‡ Received too late to be included in means and summaries. Post office address of: Altona is Adrian; Clearwater Dam is Piedmont; Crane Mountain is Arcadia; East End is Goodland; Hailey is Cassville; High Lookout is Birch Tree; Macedonia Lookout is Doniphan; Oates Tower is Centerville; Perry is Center; Pineview Lookout is Cape Fair; Sugar Camp Lookout is Seligman; Topaz is Cabool; Wilderness Lookout is Lampe. (C) Airport. ¶ Indicates plus.

(Continued from page 49)

and grasses made exceptional growth and development, but the frequent rains and wet fields greatly hampered the harvesting of small grains and haying operations. Harvesting of the wheat and oat crops was practically completed during the month, but considerable loss of these crops occurred as continued wet fields prevented some combining, and some grain sprouted in the shock. Considerable wheat that was harvested had an unusually high moisture content, as a rule. Corn made very good growth during July and the bulk of the crop was in the tasseling stage by the end of the month, but many fields were weedy and grassy because of a lack of cultivation caused by continued wet fields. However, a record-breaking corn crop was expected to be harvested this year, based on condition of the crop at the end of July. The soybean and cotton crops made very good growth and development during the month and were in very good to excellent condition at the close, although most fields were somewhat weedy, as a rule. Bolls were about ready to open in early cotton fields at the end of July. Pastures and late hay, particularly lespedeza, were in very good to excellent condition at the end of the month and a large crop of lespedeza hay was in prospect. Gardens and truck crops made good development and growth during July and were in good condition at the end of the month, except there was too much moisture for tomatoes in the wetter areas of the State. A rather small crop of early peaches of inferior quality was marketed during the month and harvest of the late peach crop was getting underway by the end of the month. Other fruits were only fair and only about one-half a normal crop of apples was expected to be harvested this year. The ample moisture and warm humid weather during July were ideal for the growth of lawns and weekly, or more frequent, cuttings were necessary to keep the grass down and to maintain an attractive appearance; this proved to be quite an ordeal for many of the State's sweltering citizens.—M. R. W.

TEMPERATURE

The monthly mean for the State, 101 stations reporting, was 77.4°, or 0.6° cooler than the 61-year July average. The highest monthly mean was 80.6° at Caruthersville, and the lowest was 74.9° at Maryville. The highest reported was 102° at Brookfield on the 7th, and the lowest was 46° at Marble Hill on the 2d.

PRECIPITATION

The average for the State, 211 stations reporting, was 5.45 inches, or 1.92 inches more than the 61-year July average. The reatest monthly amount was 14.75 inches at Owensville, and the least was 0.84 inch at Van Buren. The greatest amount reported in a observational day was 4.68 inches at St. Louis Airport on the 5th and at Deering on the 13th. The average number of days with 0.01 inch, or more, was 11.

MISCELLANEOUS PHENOMENA

Floods.—In Grand River, at Brunswick on 1st and 23d. In Missouri River, at Waverly, continued from June to July 1st; 23d to 24th; 31st and continued into August; at Hermann and below, continued from June to July 4th; 26th to 29th. In Meramec River, at Meramec Park, on 8th; at Pacific on 9th and 26th; at Valley Park, 26th to 27th. In Osage River, at Warsaw and below, continued from June to July 4th; at Osceola, on 31st and continued into August; at Lakeside, 6th to 9th, 11th to 15th, 17th and continued into August.

Fogs.—Heavy, 8th, 9th, 11th, 13th, 14th, 15th, 16th, 19th, 21st, 27th, 28th.

Hail.—Light, 5th in St. Louis County; 10th at Louisiana; 12th at University of Kansas City; 14th at Stover; 21st at Oregon. Moderate, 21st at Maryville; 27th at Brookfield and near Browning. Heavy, 27th in Linn County. (See special storm table).

Windstorms.—19th, 22d, 25th, 26th, 27th. (See special storm table).

Observations taken at 8:00 a. m. except at 5:00 p. m. at Columbia. For Lakeside and St. Louis (Washington University) descriptions see April 1932 and August 1938 reports, respectively. * Included in next measurement.

Missouri Storms, July 1948

Place	Date	Time	Width of path	Loss of life	Value of property destroyed	Character of storm	Remarks
St. Louis	19	10:22 a.m.	....	0	$2,000	Thunderstorm and high wind	Trees and wires were blown down and four persons were slightly injured in the city. Lightning struck four buildings and a street car, resulting in $2,000 damages. Storm was accompanied by a heavy, driving rain that cut visibility to one-sixteenth mile. The storm came from the northwest.
St. Louis City and St. Louis County	22	4:15 a.m.	....	0	Minor	Thunderstorm and high wind	Minor damage to trees and wires at various places in the city and county; one plate glass window broken. Storm came from the west-northwest.
Elsberry, Lincoln County	25	7:00 p.m.	....	0	Minor	High wind	Minor damage to buildings, utility lines and automobiles caused by falling tree limbs. Minor damage to crops in low-land areas in the vicinity by standing water.
Cassville	26	2:30 a.m.	....	0	....	High wind	Trees blown down in western part of Barry County and limbs torn from trees in other sections of county. Heavy rain accompanied the storm.
Linn County	27	Between 1:00 p.m. and 2:00 p.m.	1 to 3 miles	0	$110,000	Heavy hail and high wind	Storm originated near Browning, Sullivan County and moved southeastward into Linn County. Only minor damage was done to crops in Sullivan County but in Linn County, particularly in the New Garden area, the hail damage was severe. Some corn fields were completely destroyed, others heavily damaged, while still others suffered only little or no damage. Hailstones ranged from ½ inch to 4½ inches in diameter. Communication and power lines were broken by the storm. Damage to crops estimated at $60,000 and to property $50,000. The bulk of the damage was caused by the hail.

Time used on this tabulation is Central Time, unless otherwise indicated.

WASHINGTON: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

MISSOURI - AUGUST, 1948

H. F. Wahlgren, Section Director - Saint Louis

GENERAL SUMMARY

August was a rather dry month with nearly normal temperature average, for the State as a whole. It was a favorable month for all growing crops and for outdoor and field work, generally.

Temperatures were mostly moderate and no unusually high or low readings were recorded anywhere in the State. It was the coolest August since 1946 and averaged 7.2° cooler than August a year ago. The 22d and the 23d were the warmest and the 5th and 6th the coolest days during the month, as a rule. The first half of the month averaged cooler than normal while the latter half averaged warmer than normal. Average temperatures for the month for each of the three divisions of the State, with departures from normal were: Northern, 75.9°, -0.4°; Southwestern, 76.2°, -0.7°; Southeastern, 76.6°, -0.3°; for the State, 76.2°, -0.4°.

Precipitation was irregularly distributed over the State during August, being heavier over the Northern and Southwestern Divisions than in the Southeastern Division. However, the average was below normal in all divisions, viz: Northern, 2.51 inches, -1.22 inches; Southwestern, 2.28 inches, -1.64 inches; Southeastern, 1.51 inches, -2.28 inches; for the State, 2.14 inches, -1.67 inches. The greatest monthly totals for each division occurred locally at Pleasant Hill, in the Southwestern, where 6.52 inches occurred; at Doniphan #2, in the Southeastern, where 5.14 inches fell; at Fayette, in the Northern, where 4.80 inches was received. Least monthly amounts were 0.23 inch at Leeper, 0.63 inch at Waco, and 0.68 inch at Troy. The frequency of the month's rainfall was practically normal, occurring on a total of 7 days, for the State as a whole.

The only floods in any of the larger streams of the State were those that were prevailing at the close of July and extended over into early August as follows: In the Missouri River, at Waverly, continued from July to August 1st; in the Osage River, in the reach from Osceola to Lakeside, continued from July to August 7th.

Heavy fogs occurred locally on the 6th, 8th, 9th, 10th, 11th, 14th, 15th, 16th, 17th, 22d, 28th and 30th. Light hail was reported on the 11th at Granby, on the 29th, five miles southwest of Jackson, and on the 30th near Browning. Moderate hail fell on the 12th at Sylvan Beach, St. Louis County; no damage. Heavy hail occurred at Pleasant Hill on the 2d, at 4:30 p.m., over an area of one square mile and was accompanied by high wind. Automobile tops, trees and flowers were damaged and some corn was blown down. Hailstones were 5/16" to 3/8" in diameter. Crop damage estimated at $1,000 and property damage estimated at $150. The storm came from the NE. A windstorm struck Sylvan Beach Airport, St. Louis County, at 12:10 p.m. on the 12th, resulting in property damage estimated at $11,200. One hanger was blown down and another damaged and seven airplanes were also damaged. The storm came from the west and hailstones 1/2 inch in diameter accompanied it. The storm path was 1/2 mile wide. One man was struck and killed by lightning while plowing in a field near Wheaton, Barry County, on the 25th; time unknown.

All growing crops continued to make very good progress during August and they were in good to excellent condition at the close. Harvesting and threshing of wheat and oats was completed during the month, but there was some loss of these crops due to shattered grain and sprouting in the shock. Some small grain on low ground was not harvested. However, the wheat crop was expected to be one of the largest of record. The corn crop matured nicely the latter half of the month and the bulk of that crop was out of danger of any frost that might occur by the normal date of occurrence of killing frost. Some early corn was matured enough to be used for feeding by the end of the month. Hay harvest continued during the month but was interrupted, locally, during the first half of the month, with some damage due to showers. Late hay crops, particularly lespedeza and the soy bean crop were very good and these were expected to be near record crops. Pastures held up well during the month but declined some during the latter half, when more rain was needed rather generally. Some fall plowing was underway during the last half of the month and a small acreage of fall grains had been sown by the close. Truck crops and gardens produced well and were in good condition during August but were needing more rain the latter half over much of the State. Cotton continued in excellent condition but bolls were slow in opening due to cool nights. Some picking had begun by the end of August. Harvest of late peaches was completed but the crop was worm infested and of rather poor quality, particularly in the southeastern portion of the State. A large crop of cantaloups and watermelons was marketed during the month. On the whole August was the most favorable month of the current growing season for harvesting and cultivating of crops, haying operations, and field work in general.- MRW

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 76.2°, or 0.4° cooler than the 61-year August average. The highest monthly mean was 79.3° at Kansas City Airport and Caruthersville and the lowest was 72.8° at Licking. The highest reported was 104° at Greenville and Marble Hill on the 22d and at Brookfield on the 23d, and the lowest was 46° at Elsberry on the 6th.

PRECIPITATION

The monthly mean for the State, based on reports from 106 stations, was 2.14 inches, or 1.67 inches less than the 61-year August average. The greatest monthly amount was 6.52 inches at Pleasant Hill and the least was 0.23 inch at Leeper. The greatest amount in an observational day was 4.60 inches at Pleasant Hill on the 3d. The average number of days with 0.01 inch, or more, was 7.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made approximately 7 a.m. (Local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	f	Shore ice.
b	Frozen but open at gage.	g	Floating ice.
c	Upper surface of smooth ice.	h	Pool stage.
d	Ice gorge above gage.	i	Dry at gage.
e	Ice gorge below gage.	j	Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a State basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with wind shield.
6	Precipitation measured at 6-hourly intervals, on recording gage.
M	One or more days of record missing. See Table 5 for detailed daily record.
R	Station equipped with recording gage only. All amounts in Table 3 are for the non-recording gages, except for stations with this reference.
T	Trace, an amount too small too measure.
Z	Hourly amounts from recording gage at the same site may be found in Table 4.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Table 4 data formerly published in Missouri River, Upper Mississippi, Lower Mississippi West Gulf, and South Pacific Hydrologic Bulletins. Amounts in this tables are from recording pages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary). Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, 811 Fidelity Building, Kansas City, Missouri.

MISSOURI - SEPTEMBER, 1948

H. F. Wahlgren, Section Director - Saint Louis

GENERAL SUMMARY

Mild, dry, sunny weather characterized the month of September over most of Missouri and all crops matured satisfactorily under these favorable weather conditions and the absence of frost or freezing temperatures.

Except for September a year ago the current month was the warmest month of that name since 1941 and it was the first month this year, since April, averaging warmer than normal, for the State as a whole. Daily temperatures averaged above normal during the first decade, except for a brief cool period from about the 8th to 10th, and below normal during the last 10 days, as a rule. There were no unusual extremes of temperature recorded during the month and no freezing occurred anywhere in the State. All divisions of the State had monthly averages in excess of their respective normals, as follows: Northern, 70.1°, +2.3°; Southwestern, 70.5°, +0.7°; Southeastern, 70.6°, +0.4°; for the State, 70.4°, +1.1°. A few stations in each division had below-normal temperature averages for the month, these being mostly in the southern half of the State.

Precipitation during September was decidedly deficient over the Southwestern Division and averaged considerably less than normal over both the Northern and Southeastern Divisions. Monthly averages, with departures from normal, were as follows: Northern, 2.34 inches, -1.85 inches; Southwestern, 1.74 inches, -2.55 inches; Southeastern, 2.39 inches, -1.25 inches; for the State, 2.17 inches, -1.87 inches. This was the driest September since 1940, for the State as a whole. The distribution of the rainfall during the month was very irregular, ranging from a total of 5.63 inches at Sikeston, to only 0.06 inch at Seligman. As a rule, the greater portion of the month's precipitation occurred on the 7th-8th, after which there was very little rainfall, particularly over much of the Southwestern Division. There was no snowfall reported anywhere in the State during the month.

No floods or destructive storms occurred during the month. However, there was some minor local damage to power and communication lines at Springfield on the 7th, during a heavy thunderstorm. Three cows were reported killed by lightning near Clifton City on the 21st. Heavy fog formed, locally, on the 2d, 3d, 5th, 6th, 9th, 10th, 21st, 22d and 30th. Light hail fell at High Lookout on the 3d, at Bolivar on the 6th, and at King City on the 20th.

The warm, dry weather during most of September was generally ideal for maturing of the corn, soybean, and cotton crops but it was mostly too dry for plowing and seeding of fall grains, as a rule. The bulk of the corn was safe from frost damage by the close of the month and some picking had begun. A record yield was anticipated. Soybeans matured nicely and were about ready for harvesting by the end of September, with record yields expected. Cotton bolls opened rapidly during the month and picking was in progress as the month ended; the crop was unusually good. Pastures declined some due to the dry weather but were still better than usual at this time of year. Some small grains were sown during the month but the surface moisture was generally too deficient for seeding on a large scale. Haying and threshing were completed by the middle of the month and apple harvest was underway the latter half. Gardens and truck crops were in good condition and still producing at the end of September as no frost or freezing had occurred up to that time. More moisture was needed to prepare the ground and for seeding of small grain crops and for pastures as the month closed.- MRW

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 70.4°, or +1.1° warmer than normal. The highest monthly mean was 73.1° at Warsaw and Caruthersville, and the lowest was 68.3° at Elsberry. The highest reported was 100° at St. Charles on the 20th, and the lowest was 37° at Tarkio on the 27th and 28th.

PRECIPITATION

The average for the State, based on reports from 105 reporting stations, was 2.17 inches, or 1.87 inches less than normal. The greatest monthly amount was 5.63 inches at Sikeston, and the least was 0.06 inch at Seligman. The greatest amount reported in an observational day was 2.53 inches at Bolivar on the 7th. The average number of days with 0.01 inch, or more, was 5.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made approximately 7 a.m. (Local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	f	Shore ice.
b	Frozen but open at gage.	g	Floating ice.
c	Upper surface of smooth ice.	h	Pool stage.
d	Ice gorge above gage.	i	Dry at gage.
e	Ice gorge below gage.	j	Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a State basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

When hourly precipitation is accumulated over a period of three or more calendar days, with unknown hourly or daily distribution, the first and last days are shown in Table 4.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, river stages in feet, and wind movement in miles.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with wind shield.
6	Precipitation measured at 6-hourly intervals, no recording gage.
B	Adjusted to a full month.
m	One or more days of record missing. See Table 5 for detailed daily record.
r	Station equipped with recording gage only. All amounts in Table 3 are for the non-recording gages, except for stations with this reference.
T	Trace, an amount too small to measure.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Table 4 data formerly published in Missouri River, Upper Mississippi, Lower Mississippi West Gulf, and South Pacific Hydrologic Bulletins. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary). Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, 811 Fidelity Building, Kansas City, Missouri.

MISSOURI - OCTOBER, 1948

H. F. Wahlgren, Section Director - Saint Louis

GENERAL SUMMARY

This month averaged both colder and drier than normal but it was a favorable month for seasonal outdoor activities and for maturing, harvesting and seeding of fall crops.

It was the coldest October since 1932, for the State as a whole, and averaged 9.4° colder than October a year ago. All divisions of the State had monthly averages lower than normal, viz.:- Northern, 54.4°, -1.7°; Southwestern, 56.8°, -1.7°; Southeastern, 56.2°, -2.5°; for the State, 55.8°, -2.1°. Extremes of temperature for the month were well within the extremes previously established for October. The 1st, 5th, 13th, and 14th were the warmest days during the month and the 18th was the coldest day, as a rule. The first general killing frost of autumn occurred on the 18th, ending the 1948 growing season, which was longer than usual this year. Many stations in the Northwestern quarter of the State had their first killing frost on the 17th. The only extended and pronounced warm period during the month occurred during the last week.

Precipitation during October was all in the form of rain, no snowfall being reported anywhere in the State. The distribution was irregular, ranging from a total of 4.53 inches at St. Louis Airport to only 0.76 inch at Neosho, but the frequency was exactly normal, rain occurring on an average of 6 days during the month. However, amounts were generally deficient and the monthly average of 2.40 inches for the State was 0.56 inch less than normal. The monthly averages by divisions, with departures from normal were:-Northern, 2.22 inches, -0.46 inch; Southwestern, 2.40 inches, -0.74 inch; Southeastern, 2.58 inches, -0.47 inch. Several stations in each of the three divisions of the State received monthly totals in excess of normal, but the excesses were, as a rule, less than one inch. Heaviest amounts occurred on the 6th and 7th and on the 30th and 31st, when over an inch of rain fell at a number of stations.

No damaging storms of any kind and no floods in any of the larger streams or rivers of the State, occurred during October.

Miscellaneous Phenomena reported were as follows:-Aurora on 17th. Heavy fogs on 4th, 5th, 9th, 11th, 12th, 20th, 22d, 23d, 24th, 25th, 26th, 30th, and 31st. Killing frosts on 17th and 18th. Light hail on 29th at Maryville, and on 30th at Albany and Kansas City Airport. Moderate hail on 16th at Chillicothe Airport; on 30th at University of Kansas City; on 31st at Kirksville Airport. Sleet, locally on 10th.

Ideal autumn weather during most of October permitted seeding of all small grain crops and most of this work was completed during the month, but germination and growth were retarded somewhat, especially in the southwestern portion of the State, by the rather dry weather. A somewhat larger than normal acreage was sown to wheat this fall. All crops had safely matured by the time of occurrence of the first killing frosts on the 17th and 18th and no damage was done to staple crops as a result of the general frost and freeze. The corn crop was being harvested throughout the month and yields per acre were setting a new record in many areas of the State, particularly in the northwestern portion. The crop as a whole was exceptionally good, both in quality and quantity. Harvest of a record soybean crop was in progress during the month with yields per acre also establishing a new record. Cotton picking made good progress during October and this crop, too, was expected to be the largest ever produced in the cotton growing areas of the southeastern portion of the State. Pastures deteriorated considerably from lack of moisture, until the closing days of the month, but were still providing more grazing than at this time last year. Open weather and lack of snowfall permitted range of pastures and grazing lands throughout the month and dry feeding was reduced to a minimum. As the month ended generous amounts of rains had fallen, or were falling, which greatly relieved the drier areas of the State, particularly the southwest and central portions. - M.R.W.

TEMPERATURE

The monthly mean for the State, 106 stations reporting, was 55.8°, or 2.1° lower than the 61-year October average. The highest monthly mean was 60.6° at Caruthersville, and the lowest was 52.1° at Tarkio and Unionville. The highest reported was 86° at Marshfield on the 5th, and the lowest was 18° near Anderson on the 18th.

PRECIPITATION

The average for the State, based on reports from 106 stations, was 2.40 inches, or 0.56 inch less than the 61-year October average. The greatest monthly amount was 4.53 inches at St. Louis Airport, and the least was 0.76 inch at Neosho. The greatest amount reported in an observational day was 2.34 inches at Burlington Junction on the 30th. The average number of days with 0.01 inch, or more, was 6.

There was no snowfall reported anywhere in the State.

- - - - -

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 nonrecording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (Local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a State basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

When hourly precipitation is accumulated over a period of three or more calendar days, with unknown hourly or daily distribution, the first and last days are shown in Table 4.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, river stages in feet, and wind movement in miles.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with wind shield.
6	Precipitation measured at 6-hourly intervals, no recording gage.
B	Adjusted to a full month.
m	One or more days of record missing. See Table 5 for detailed daily record.
r	Station equipped with recording gage only. All amounts in Table 3 are for the non-recording gages, except for stations with this reference.
T	Trace, an amount too small to measure.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Table 4 data formerly published in Missouri River, Upper Mississippi, Lower Mississippi West Gulf, and South Pacific Hydrologic Bulletins. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary). Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, 811 Fidelity Building, Kansas City, Missouri.

MISSOURI - NOVEMBER, 1948

H. F. Wahlgren, Section Director - Saint Louis

GENERAL SUMMARY

The past month averaged both warmer and wetter than normal, for the State as a whole, and it was a favorable month for seasonal outdoor work, as a rule.

Except for a few stations in the southwestern quarter of the State, temperatures averaged above normal for November at all stations. Averages by divisions with departures from normal were: Northern, 44.3°, +2.1°; Southwestern, 47.0°, +1.1°; Southeastern, 48.1°, +1.9°; for the State, 46.5°, +2.1°. There were no unusual extremes of temperature recorded anywhere in the State. The 4th, 5th, and 15th were generally the warmest days during the month while the 22d, 23d and 29th were the coldest days, as a rule. Compared to last November the current month averaged 5.5° warmer than that month.

The precipitation during the month was mostly in the form of rain, snowfall being of little consequence, except at a few widely separated stations. The distribution of the month's precipitation was very irregular, ranging from a total of 9.18 inches at Parma to only 0.70 inch at Albany. The Southeastern Division received the greatest precipitation average during the month, 5.03 inches, or 1.77 inches more than normal. The averages, with departure from normal, for the Northern and Southwestern Divisions were 2.45 inches, +0.23 inch and 3.40 inches, +0.74 inch, respectively. The State average was 3.64 inches, or 0.93 inch more than normal. The frequency was greatest over the Southeastern Division where measurable precipitation occurred on an average of 11 days during November. The average frequency for the entire State was 9 days, or 3 days more than normal. Heaviest precipitation occurred on the 2d and 5th when amounts of from more than two to over four inches occurred locally in the central portion of the State. Heaviest amounts of snowfall occurred in Barry, Shannon and Oregon counties on the 28th, when up to 3 inches fell in the first named county. The snowfall melted rapidly however and the ground was not covered for more than a day or two at any place. Many stations in the State reported none to only a Trace of snow during November.

There were no floods in any of the larger streams or rivers of the State during November.

Generally high straight-line winds over all of the State on the afternoon of the 16th resulted in minor damage to trees, signs, wires, plate glass windows and the steeple of a church in the St. Louis area. The same day a plate glass window was blown out of a store at Martinsburg and one person was slightly injured by flying glass. Between 1 p.m. and 4 p.m. on the 19th, high straight-line winds resulted in minor damage to signs, roofs, and a few farm fences in St. Louis City and in St. Louis County. During the night of the 27th and forenoon of the 28th high wind, accompanied by a 2.5 inch snowstorm, disrupted power and light service for about six hours at Cassville and vicinity.

Miscellaneous phenomena reported were as follows: Heavy fogs on 1st, 2d, 3d, 13th, 18th, 19th, 23d, 24th, 26th, 27th, 29th. Glaze on 19th and 28th. Light hail on 4th near Browning; on 18th at Kansas City Airport, Bolivar, and Clinton; on 19th at Kirksville, Maryville, and Warrenton. Moderate hail on 1st at Pierce City; on 4th at Cassville; on 18th at Oregon and University of Kansas City with some window panes broken and a floral shop damaged at the latter place. Sleet on 4th, 9th, 19th, and 28th.

The mild open weather was quite favorable for most outdoor work during much of the month and a large percentage of the unusually large corn and cotton crops was harvested and stored, although rather frequent rains in the southeast portion interfered with cotton picking. Considerable fall plowing was accomplished during the month over most of the State. The warm weather and generally adequate precipitation improved the condition of pastures and fall seedings of small grains and alfalfa and these made very good growth and progress during the month, except in the extreme southwestern counties where more moisture was needed to promote growth of the winter wheat crop and other small grains that had been seriously retarded by persistent dry weather in that area. With the approach of the coming winter the State was in better condition, as far as stores of feed and fuel supplies were concerned, than for many years.-MRW

TEMPERATURE

The monthly mean for the State, 105 stations reporting, was 46.5°, or 2.1° warmer than the 61-year November average. The highest monthly mean was 52.7° at Caruthersville, and the lowest was 41.4° at Tarkio. The highest reported was 87° at Caruthersville on the 3rd and the lowest was 10° at Monett on the 29th.

PRECIPITATION

The average for the State, based on reports from 104 stations, was 3.64 inches, or 0.93 inch more than the 61-year November average. The greatest monthly amount was 9.18 inches at Parma, and the least was 0.70 inch at Albany. The greatest amount reported an an observational day was 4.55 inches at Jefferson City on the 2nd. The average number of days with 0.01 inch, or more, was 9.

Snowfall averaged 0.1 inch, or 0.8 inch less than the 59-year November average. The greatest monthly snowfall was 3.0 inches at Seligman and Summersville.

- - - - -

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (Local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	f	Shore ice.
b	Frozen but open at gage.	g	Floating ice.
c	Upper surface of smooth ice.	h	Pool stage.
d	Ice gorge above gage.	i	Dry at gage.
e	Ice gorge below gage.	j	Interpolated.

REFERENCE NOTES

The four digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

Amounts in Table 4 are from recording gages. Traces are not shown.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Precipitation measured at 6-hourly intervals, no recording gage.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ration of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record.
R	Station equipped with recording gage only. All amounts in Table 3 are for non-recording gages, except for stations with this reference.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
Z	Hourly amounts from recording gage at the same site may be found in Table 4.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary). Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, 811 Fidelity Building, Kansas City, Missouri.

MISSOURI - DECEMBER, 1948

H. F. Wahlgren, Section Director - Saint Louis

GENERAL SUMMARY

The past month averaged considerably warmer than normal over all divisions of the State, while precipitation averaged slightly less than normal over the Northern and Southwestern Divisions and slightly more than normal over the Southeastern Division. Outstanding features of the month were the generally high winds on the 5th, the unusually warm period from the 11th to 16th and the severe cold wave of the 25th-26th.

Although the average temperature for the month was 2.8° warmer than normal, this was the coldest December in the past three years. An unusually warm spell occurred from the 11th to the 16th, during which time the highest temperature occurred. Maximum temperatures on the 13th and 15th were in the high 60's to the low 80's and a number of stations reported the highest temperature of record for December on the former date. A severe cold period occurred on the 25th and 26th, when the lowest temperatures for the month occurred, and minimums ranged from an extreme low of 26° below zero at Bethany to 20° at Caruthersville. As a rule, the first half of the month averaged considerably warmer than normal while the last half averaged colder than normal. The average temperatures, with departures from normal, by divisions, were: Northern, 33.0°, +2.2°; Southwestern, 38.7°, +3.4°; Southeastern, 39.6°, +3.4°; for the State, 37.1°, +2.8°. Marble Hill was the only station in the State with a monthly average lower than normal.

Precipitation for the month averaged practically normal, for the State as a whole. However, the average for the Southeastern Division was above normal while for the Northern and Southwestern Divisions it was below normal. Actual averages and departures from normal for each division were as follows: Northern, 1.44 inches, -0.14 inch; Southwestern, 1.56 inches, -0.48 inch; Southeastern, 3.44 inches, +0.55 inch; for the State, 2.18 inches, +0.01 inch. The distribution of precipitation during the month was decidedly irregular, ranging from a total of 7.31 inches at Deering to only 0.57 inch at Madison. The monthly totals were from a combination of rain, snow, and sleet at most stations, especially in the northern half of the State, where the snowfall during the month was heaviest. In the southern half of the State snowfall was relatively light, as a rule, especially in the extreme southern portions, where very little or no snowfall occurred at a number of stations. Heaviest precipitation occurred on the 15th and 24th when 24-hour amounts of from one to over three inches were recorded at one or more stations in each division on one or the other date. The ground was bare over most of the State until the 24-25th when rather heavy snowfall occurred over the northern and central portions and remained on the ground, in decreasing amounts, for 4 or 5 days in central portions of the State and for the remainder of the month in the more northern portions.

There were no floods in any of the major rivers or streams of the State during December.

Unusually high straight-line wind from the southwest was general over the entire State all day of the 5th, resulting in considerable minor property damage at a number of places in the central and eastern portions of the State. Places reporting damage were St. Louis and vicinity where trees and wires were blown down or broken, plate glass windows blown out and cornices and roofs of some buildings damaged; also many street lights were broken. Aggregate damage in the St. Louis area was estimated at several thousand dollars. At Fulton and in Callaway County more than $5,000 damage resulted as the high wind damaged roofs and cornices of buildings, broke windows, blew down one barn and moved a church from a temporary foundation about 15 feet, broke trees and wires and blew down haystacks. At Jefferson City a new airplane hangar at the Municipal Airport suffered damage estimated at $1,000 to $1,500 and some wires and trees were also damaged. At Martinsburg roofs and trees were damaged and haystacks on farms blown over; one store roof was partly torn off with damage estimated at $100. At Columbia and surrounding area trees, wires, and window glass were broken and Christmas street decorations were blown down. A barn was demolished near Sturgeon, killing nine calves and several pigs. Boundary lights and storm windows at the Municipal Airport at Columbia were damaged about $100. At Shelbina and over the greater part of Shelby County, about 30 roofs, and some windows and porches were damaged and a few poultry houses and one windmill were blown down; also a few telephone and electric poles were downed. At Camdenton and the Lake of the Ozarks area, shingles were blown from roofs and numerous trees were blown down. At Lakeside some damage occurred to trees, roofs, power lines, etc. At Joplin numerous trees were damaged and a barn was blown down south of the city. No doubt considerably more damage occurred at other places which was not reported due to the minor nature of the damage.

Miscellaneous phenomena reported were as follows: Dust, locally on 5th and 6th. Heavy fogs, 2d, 2d, 4th, 12th, 13th, 14th, 15th, 18th, 25th, 26th, 28. Glaze, 18th, 23d, 24th, 25th, 28th, 29th. Light hail on 5th at Maryville; 24th at Neosho; 28th at University of Kansas City. Sleet, 18th, 22d, 23d, 24th, 25th, 26th, 28th, 29th.

Very little field work was accomplished during December, except for some late fall plowing in the west-central and southwest portions of the State, and harvesting of the remainder of the corn, cotton, and soybean crops. Wheat and other fall-sown small grains continued to make some growth until the severe cold wave of the 25-26th after which these crops were frozen down and remained dormant, thereafter. Main outdoor activities on Missouri farms during much of the month, particularly the latter half, were confined to seasonal chores of feeding and caring for livestock, wood cutting, repairing machinery and fences and planning for the next years crops. Lack of snow cover permitted range of stalk fields and permanent pastures by livestock until the 24-25th, after which dry feeding was altogether necessary over all of the State except the extreme southern portion. The condition of the winter wheat crop at the close of the month ranged from fair in the southwest quarter to good to excellent elsewhere over the State. The snowfall that fell on the 24-25th provided adequate protection for that crop in northern and central sections against the extremely low temperatures that immediately followed. There were adequate supplies of water and moisture for all current needs at the end of the month.

TEMPERATURE

The monthly mean for the State, 107 stations reporting, was 37.1°, or 2.8° warmer than the 61-year December average. The highest monthly mean was 45.3° at Caruthersville, and the lowest was 27.9° at Tarkio. The highest reported was 81° at Ozark Beach on the 14th, and the lowest was 26° below zero at Bethany on the 26th.

PRECIPITATION

The average for the State, based on reports from 106 stations, was 2.18 inches, or 0.01 inch more than the 61-year December average. The greatest monthly amount was 7.31 inches at Deering, and the least was 0.57 inch at Madison. The greatest amount reported in an observational day was 3.09 inches at Williamsville on the 15th. The average number of days with 0.01 inch, or more, was 7.

Snowfall averaged 3.8 inches for 100 stations, or 0.3 inch more than the 59-year December average. The greatest monthly snowfall reported was 15.8 inches at King City.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (Local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	f	Shore ice.
b	Frozen but open at gage.	g	Floating ice.
c	Upper surface of smooth ice.	h	Pool stage.
d	Ice gorge above gage.	i	Dry at gage.
e	Ice gorge below gage.	j	Interpolated.

See reference notes following Station Index.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rain fall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

Tables 6 and 7 for this issue will be found on page 170.

REFERENCE NOTES

The four digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

Amounts in Table 4 are from recording gages. Traces are not shown.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Precipitation measured at 6-hourly intervals, no recording gage.
B	Adjusted to a full month.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing; see Table 5 for detailed daily record.
R	Station equipped with recording gage only. All amounts in Table 3 are for non-recording gages, except for stations with this reference.
T	Trace, an amount too small to measure.
V	Includes total for previous month.
Z	Hourly amounts from recording gage at the same site may be found in Table 4.
SS	This entry in time of observation column in Station Index means observation made near sunset.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary). Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, 811 Fidelity Building, Kansas City, Missouri.

CORRECTIONS

June 1948, page 42, Lexington, date of Minimum Temperature should be the 1st. Page 43, St. Louis University, Mean Temperature and Departure from Normal should be 75.2 and 0.0, respectively. July 1948, page 53, Waco, Precipitation on the 31st should be .02, and Total Precipitation for the month should be 6.78. August 1948, Table 3, Altona, Total Precipitation should be 3.78. Table 7, Valley Park, readings from 3rd through 31st should be minus quantities. high should be 0.1 on the 1st and low should be -1.5 on the 26th. August through October 1948, Table 4, data published under name of Jefferson City should have been published under Jefferson City Radio KWOS. October 1948, Table 5, Poplar Bluff, Maximum Temperatures on the 7th and 21st should be 70 and 63 respectively. Minimum Temperature on the 17th should be 38. Mean Maximum should be 74.5 and Mean Minimum 41.1.

MISSOURI, 1948

H. F. Wahlgren, Section Director - Saint Louis

GENERAL SUMMARY

The year 1948 was a normal one with respect to average temperature for the State as a whole. The extremes of temperature were not unusual. Precipitation for the year was slightly below the 61-year average; however, the early summer was exceptionally wet. With the exception of a few periods the year, as a whole, was favorable for most activities which are seriously affected by weather conditions. Major storm damage occurred in January, March, May and June, with some serious local damage reported in April and July. No serious floods occurred on the major rivers, but during the periods of heavy precipitation in June and July, extensive flooding occurred in many of the smaller streams throughout the State, and resulted in considerably above-normal stages for that season of the year, in some of the larger rivers and minor flooding of low ground.

The average temperature, 55.2°, was the same as the 61-year average. Only the months of January and April had any marked departures from their normals. January was exceptionally cold, with a departure of -5.2°, and April exceptionally warm with a departure of +5.2°. The highest temperature reported was 104° at Greenville and Marble Hill on August 22d, and at Brookfield on August 24th. The lowest temperature reported was 26° below zero at Bethany on December 26th. The 11th and 12th of March were exceptionally cold for so late in the season, with near or below-zero temperatures reported in all sections of the State, except the extreme southeast corner. Lower minimum March temperatures were reported only in 1943.

The average precipitation for the year was 39.59 inches, compared with the 61-year average of 40.49 inches. The average for the month of April was the least for any April during the period of record. Heavy to excessive precipitation in June and July made the early summer exceptionally wet. During this period heavy precipitation occurred in all sections of the State. Several stations reported 24-hour amounts in excess of 4 inches, and three reported amounts in excess of 5 inches. Monthly totals for June ranged as high as 17.29 inches at Concordia, and for July, 14.75 inches at Owensville. Snowfall for the year was somewhat above the average.

January was not a favorable month for outside work. Cold and rather frequent periods of precipitation limited most field work to extreme southern sections. Traffic on highways was halted or seriously impeded by a severe glaze and sleet storm on the 1st over much of the State and locally on several other dates. Winter grains were sufficiently protected by snow cover and were not damaged by cold weather. Minor floods occurred in the Black, Meramec and St. Francis Rivers early in the month, with little damage reported. Major storm damage occurred in the glaze, sleet and wind storm of the 1st.

February was normal in most respects. Usual outdoor activities were not affected. Minor windstorm damage occurred on the 27th; total amount reported was $2,500. Minor flooding occurred in some localities on the Grand and Mississippi Rivers.

March was rather cold, wet and windy. Outside activities were somewhat delayed; however, any losses caused by delay were more than compensated for by the above-normal precipitation, which ended the water shortage that had developed in some localities. Heavy storm damage was reported during the last half of the month. Minor to moderate flooding occurred in the Grand, Meramec, Missouri and Mississippi Rivers.

April was mild and rather dry. It was a very favorable month for outside work, and delays caused by adverse weather during March were overcome. A tornado occurred on the 6th in Randolph County, and caused rather extensive damage in that locality. Slight flooding occurred in the Mississippi River.

May was a favorable month for all outdoor activities. Precipitation, although somewhat below normal, was mostly sufficient for current needs. Major storm damage occurred in some sections of the State on the 1st, and minor damage was reported on the 10th and 15th. Slight flooding occurred in the Mississippi and St. Francis Rivers.

June, although too wet for hay and small grain harvest, was an excellent month for growing crops. Rather extensive storm damage occurred during frequent wind, electrical and hail storms. Severe flooding in many of the smaller streams during the latter part of the month caused some crop damage. Minor flooding occurred in the Missouri, Gasconade, Grand and Osage Rivers.

Frequent precipitation during July continued to impede hay and small grain harvest, but growing crops continued to make better than average progress. A heavy hail and wind storm caused considerable damage in Linn County on the 27th. Severe flooding in many of the smaller streams continued from June. Minor to moderate floods occurred in portions of the Grand, Missouri, Meramec and Osage Rivers.

Favorable weather conditions prevailed throughout the month of August. Light precipitation permitted completion of the much-delayed small grain and hay harvest. Losses incurred from spoilage of small grain and hay were offset by the exceptionally large corn crop. Only minor storm damage was reported. Slight flooding occurred in the Missouri and Osage Rivers.

Favorable mild dry weather continued during most of September.

Ideal autumn weather prevailed through October. Killing frost occurred over much of the State on the 17-18th, but crops had generally matured and little damage resulted from the frost.

November was a favorable month for most seasonal outdoor activities. Minor windstorm damage occurred in scattered areas on the 16th, 19th, 27th and 28th.

December, as a whole, was favorable for usual outside winter pursuits. A general windstorm on the 5th resulted in widely scattered minor property damage throughout the State. A severe cold wave occurred on the 25-26th, when the lowest temperatures for the year were recorded.--HWR

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rain fall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U. S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of Climatological Data.

- - No record.
- + Also later dates or months.
- // Gage is equipped with a windshield.
- B Adjusted to full month.
- E Water equivalent of snowfall wholly or partially estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 10 days' record missing; see monthly Climatological Data for detailed daily record.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription price for this bulletin is 15 cents per copy or $1.50 a year (Yearly subscription includes the annual summary). Correspondence regarding subscriptions should be addressed to Weather Records Processing Center, 811 Fidelity Building, Kansas City, Missouri.
